

2022 Chemistry Preliminary Examinations

Mark Scheme (Paper 2)

Question	Mark Scheme	Mark
A1(a)	He, H <sub>2</sub> , O <sub>2</sub> , Cl <sub>2</sub> (any two)	1
A1(b)	NH <sub>3</sub> and CH <sub>4</sub>	1
A1(c)	CO <sub>2</sub> and O <sub>2</sub>	1
A1(d)	CH <sub>4</sub>	1
A1(e)	CO	1
A2(a)(i)	Number of neutrons = 48 Nucleon number = 56 [1] Both correct	1
A2(a)(ii)	2 8 8 1	1
A2(a)(iii)	E <sup>2-</sup> Accept O <sup>2-</sup> as the assessment objective is to see if student know that E can form an anion with -2 charge.	1
A2(a)(iv)	A and E Both A and E are atoms that have the same number of protons but different number of neutrons. [1] for correct identification of isotopes and explanation. No need 'atoms' since the question context has already stated. Accept: same proton number, atomic number (since these are scientific terms) Reject: neutron number (no such scientific term), nucleon number (need to break down what this term means and go back to the definition)	1
A2(b)(i)	B: nitrogen D: potassium F: iron	1
A2(b)(ii)	Highest melting point: iron (F) potassium (D) Lowest melting point: nitrogen (B) CAO: No edf b(i)	1
A2(b)(iii)	B has weak intermolecular forces of attraction / weak forces of attraction between the molecules. Hence, less energy is absorbed to overcome the bonds. F has strong electrostatic forces of attraction / metallic bonds between the cations and 'sea' of delocalised electrons. Hence, more energy is required to overcome the bonds. [1] Correct types of bonds and particles [1] Energy comparison only awarded if bonds and particles are correct. No edf (b)(ii)	1 1

Question	Mark Scheme	Mark
A2(c)	 <p>[1] Correct number of electrons drawn for cation C<sup>+</sup> and anion B<sup>3-</sup> [1] Correct charges and ratio of cations to anion (3:1)</p>	2
A3(a)	Manganese has variable oxidation states, +2 in Mn <sup>2+</sup> /Mn(OH) <sub>2</sub> and +3 in Mn(OH) <sub>3</sub> . MnSO <sub>4</sub> acts as a catalyst as MnSO <sub>4</sub> in step 1 is regenerated in step 3.	1 1
A3(b)	2Mn(OH) <sub>2</sub> (s) + 2I <sup>-</sup> (aq) + 6H <sup>+</sup> (aq) → 2Mn <sup>2+</sup> (aq) + I <sub>2</sub> (aq) + 6H <sub>2</sub> O(l) correct balanced equation (ignore state symbols)	1
A3(c)(i)	+2	1
A3(c)(ii)	I <sub>2</sub> is reduced as the oxidation of iodine decreases from 0 in I <sub>2</sub> to -1 in NaI. Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> is oxidised as the oxidation of sulfur increases from +2 in Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> to +2.5 in Na <sub>2</sub> S <sub>4</sub> O <sub>6</sub> . Ecf for oxidation state of sulfur in Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> only if the oxidation state is increased.	1 1
A3(d)	Colour changes from bluish-black/blue-black to colourless. Reject: Blue or black only.	1

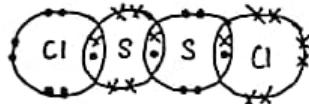

Question	Mark Scheme	Mark
A3(e)	<p>Moles of <math>\text{Na}_2\text{S}_2\text{O}_3</math> used = <math>0.0100 \times (11.20/1000) = 0.000112 \text{ mol}</math></p> <p>Moles of <math>\text{I}_2 = 0.000112 / 2 = 0.0000560 \text{ mol}</math></p> <p>Moles of <math>\text{Mn}(\text{OH})_3 = 2 \times 0.0000560 = 0.000112 \text{ mol}</math></p> <p>Moles of <math>\text{O}_2</math> present = <math>0.000112 / 4 = 0.0000280 \text{ mol}</math></p> <p>Concentration of <math>\text{O}_2 = 0.0000280 \times (100/1000) = 0.000280 \text{ mol/dm}^3 \text{ CAO}</math></p>	<p>1</p> <p>1</p> <p>1</p>
A4(a)(i)	<p>Density = <math>16 / 24 = 0.667 \text{ g/dm}^3</math></p> <p>Award for numerical answer only. Ignore units if missing.</p>	1
A4(a)(ii)	<p>Energy per gram = <math>762 / 32 = 22.7 \text{ kJ/g}</math></p> <p>Award for numerical answer only. Ignore units if missing.</p>	1
A4(a)(iii)	<p>Petrol is not a pure substance OR it consists of a mixture of hydrocarbons.</p> <p>Hence, there is no fixed enthalpy change of combustion.</p>	1
A4(b)(i)	 <p>Correct formulae of products. Ignore if equation is not balanced. [1]</p> <p><math>\Delta H</math> (with energy level) [1]</p> <p>activation energy [1]</p>	<p>1</p> <p>1</p> <p>1</p>

Question	Mark Scheme	Mark
A4(b)(ii)	<p>Methane has a higher percentage of carbon than methanol.</p> <p>For the same number of moles of fuel, methane requires more oxygen for complete combustion OR more likely to undergo incomplete combustion.</p> <p>Hence, methane is more likely to undergo incomplete combustion.</p>	<p>1</p> <p>1</p>
A4(c)	<p>Complete combustion of hydrogen produces only water which is a non-pollutant.</p> <p>However, combustion of methane produces carbon dioxide which is a greenhouse gas that leads to global warming.</p>	<p>1</p> <p>1</p>
A4(d)(i)	<p><math>\Delta H = 3(410) + 360 + 463 - 2(435) - 1077</math></p> <p><math>= 2053 - 1949</math></p> <p><math>= +104 \text{ kJ/mol}</math></p> <p>CAO, must include a positive sign. Ignore missing units</p>	<p>1</p> <p>1</p>
A4(d)(ii)	<p>Step 1 is endothermic OR Energy is absorbed when methanol is converted from a liquid to a gas.</p> <p>OWTTE to mention energy change due to the change in physical states</p>	1
A4(d)(iii)	<p>The carbon monoxide produced is toxic as it binds to haemoglobin / prevents the blood to transport oxygen and leads to breathlessness and eventually death.</p> <p>OWTTE about the inability to transport oxygen</p> <p>OR</p> <p>The methanol used is toxic as it can lead to headache, dizziness or loss of consciousness.</p>	1
A5(a)(i)	$\text{C}_5\text{H}_{10}$	1
A5(a)(ii)	<p>Condition: <u>uv light</u></p> <p><math>\text{C}_4\text{H}_8 + \text{Cl}_2 \rightarrow \text{C}_4\text{H}_7\text{Cl} + \text{HCl}</math></p> <p>No need state symbols. Multiple chlorine-substituted product must come with corresponding HCl.</p>	<p>1</p> <p>1</p>
A5(b)(i)	$\text{C}_6\text{H}_6$	1

	C	H	O	Br																						
Mass / g	100 - 88.7 = 31.3 g	5.9 g	10.5 g	52.3 g	includes assumption of mass above.																					
Mole /mol	31.3 / 12 = 2.61	5.9 / 1 = 5.9	10.5 / 16 = 0.656	52.3 / 80 = 0.654	2 to 3 sf																					
Simplest mole ratio	4	9	1	1	No mark To be awarded in EF																					
B6(a)(i)	<p>Electronegativity <u>decreases down Group II elements</u>.</p> <p>As the <u>atomic size increases</u>, the <u>attraction between the nucleus and valence electrons is weaker</u>, making the atom less likely to attract electrons.</p>	<p>1</p> <p>1</p>																								
B6(a)(ii)	Any value between 0.82 to 0.98 (actual 0.93)	1																								
B6(b)	Helium, neon and argon have <u>fully filled valence electron shells</u> and they are <u>unable to form bonds</u> with other elements.	<p>1</p> <p>1</p>																								
B6(c)	<p><math>\Sigma</math> of Al<sub>2</sub>O<sub>3</sub> = 3.44 - 1.61 = <u>1.83</u> and <math>\Sigma</math> of AlCl<sub>3</sub> = 3.16 - 1.61 = <u>1.55</u> CAO</p> <p><math>\Sigma</math> value of Al<sub>2</sub>O<sub>3</sub> does not support. Al<sub>2</sub>O<sub>3</sub> is an <u>ionic compound</u> but its <math>\Sigma</math> is <u>less than 2.0</u>.</p> <p><math>\Sigma</math> value of AlCl<sub>3</sub> supports the bonding in AlCl<sub>3</sub>. [no mark]</p>	<p>1</p> <p>1</p>																								

Question	Mark Scheme	Mark
B6(d)	<p><u>Student 1</u> No. [No mark] For example, <math>\Sigma</math> value (H-F) / bond energy of H-F = <math>1.78/562 = 0.00317</math> and <math>\Sigma</math> value (H-Cl) / bond energy of H-Cl = <math>0.96/431 = 0.00223</math> do not give the same constant value. [1]</p> <p>Accept: Other examples with single covalent bonds.</p> <p><u>Student 2</u> From table 6 3, there is only one <math>\Sigma</math> value for CO bond and it cannot be used to predict the bond strengths of C-O, C=O or C<math>\equiv</math>O (cannot tell the difference between the type of bonds in CO and hence the strengths).</p>	1
B6(e)(i)	Nitrogen is <u>more electronegative</u> than hydrogen and the <u>bonding electrons should be closer to the nucleus of the nitrogen</u> .	1
B6(e)(ii)	 <p>[1] both sulfur atoms (Must be illustrated by 'dots' and 'crosses' to show how each atom shares the electron. Reject if only crosses or dots are shown.)</p> <p>[1] both chlorine atoms with each chlorine atom bonded to different sulfur atom.</p>	1
B7(a)	The <u>electrodes and copper wires have free moving electrons</u> [1] to conduct electricity whereas the <u>electrolyte has free moving ions</u> to conduct electricity. [1]	1
B7(b)	$\text{Zn(s)} + 2\text{H}^+(\text{aq}) \rightarrow \text{Zn}^{2+}(\text{aq}) + \text{H}_2(\text{g})$ Or $\text{Zn(s)} + \text{H}_2\text{SO}_4(\text{aq}) \rightarrow \text{ZnSO}_4(\text{aq}) + \text{H}_2(\text{g})$  Accept: If no state symbols are written. Reject: If state symbols are written incorrectly.	1

Question	Mark Scheme	Mark
B7(c)(i)	$\text{Ag}^+(\text{aq}) + \text{e}^- \rightarrow \text{Ag(s)}$  Reject: If no or wrong state symbols are written.	1
B7(c)(ii)	<p>The pH of the electrolyte decreases.</p> <p><u>OH<sup>-</sup> is preferentially discharged at graphite electrode 2 and resulting in a lower OH<sup>-</sup> concentration or concentration of OH<sup>-</sup> becomes lower than concentration of H<sup>+</sup>.</u></p>	1
B7(d)	<p><u>Oxide ions are discharged to give oxygen gas at graphite electrode 2.</u></p> <p>After a long period of time, the <u>oxygen gas produced reacts / oxidises graphite electrode 2 to become carbon dioxide gas</u></p> <p>Accept: equations written for the reactions at the electrode At graphite electrode 2: <math>2\text{O}^{2-}(\text{l}) \rightarrow \text{O}_2(\text{g}) + 2\text{e}^-</math> and <math>\text{C(s)} + \text{O}_2(\text{g}) \rightarrow \text{CO}_2(\text{g})</math></p>	1
Either B8(a)(i)	<p>There is a higher concentration of hydrogen ions, H<sup>+</sup> in nitric acid than phosphoric acid.</p> <p>The <u>frequency of effective collision between the hydrogen ions and metal</u> in the alloy will be <u>higher</u> in nitric acid than phosphoric acid.</p> <p>Hence, the speed of reaction will be higher for nitric acid than phosphoric acid. [no mark]</p>	1
B8(a)(ii)	<p><math>18 \pm 1</math> hours (<math>\pm 5\%</math>)</p> <p>Minus [1] for overall paper if no units.</p>	1
B8(b)(i)	$2\text{CH}_3\text{COOH} + \text{Mg} \rightarrow (\text{CH}_3\text{COO})_2\text{Mg} + \text{H}_2$	1
B8(b)(ii)	<p><u>Add ethanoic acid in excess OR until no more effervescence is observed.</u></p> <p><u>Filter the mixture to obtain copper as the residue. Wash the residue with water to obtain pure copper.</u></p>	1

Question	Mark Scheme	Mark
B8(c)(i)	Pass the gas through acidified $\text{KMnO}_4$ .	1
	Purple acidified $\text{KMnO}_4$ decolourises.	1
B8(c)(i)	 <ul style="list-style-type: none"> <li>Amide linkage clearly shown.</li> <li>Correct number and type of atoms in polymer with the two ends of the polymer unbonded to any atoms. Bonding between atoms must be correct.</li> </ul>	1 1
Or B8(a)(i)	$\text{CO}_2 + \text{Ca}(\text{OH})_2 \rightarrow \text{CaCO}_3 + \text{H}_2\text{O}$	1
B8(a)(ii)	<p>Y, X, Z</p> <p>More reactive metal forms more thermally stable metal compounds.</p> <p>Since the rate of decomposition of <math>\text{ZCO}_3</math> is the greatest followed by <math>\text{XCO}_3</math> and <math>\text{YCO}_3</math>,</p> <p>Z is the least reactive metal followed by X and Y which is the most reactive metal. [no mark as this is awarded above]</p> <p>[1] Identify the correct relationship between metal reactivity and metal compound stability.</p> <p>[1] Use relationship above to link to data (i.e. rate of decomposition) given in the table.</p>	1 1 1
B8(b)(i)	<p>This is a reversible reaction. [no mark]</p> <p>When phosphorus reacts with bromine to form phosphorus tribromide, some phosphorus tribromide decomposes (breaks down, converted back) to give phosphorus and bromine.</p> <p>[1] awarded for the understanding of reactants converted to products and back with relevant context (i.e. identities of reactants of products stated).</p>	1
B8(b)(ii)	Chlorine is <u>more reactive</u> than bromine.	1
	The <u>rate of reaction</u> of phosphorus with chlorine should be <u>higher</u> than that with bromine.	1

Question	Mark Scheme	Mark
B8(c)(i)	 <p>Note: No need to show displayed formula. All bonds must be correctly bonded e.g. C is bonded directly to C in <math>-\text{CH}_2\text{Br}</math>.</p>	1
B8(c)(ii)	<p><math>M_r</math> of <math>\text{CH}_3\text{CHCHCH}_2\text{Br}</math> monomer = <math>4(12) + 7 + 80 = 135</math></p> <p>No. of monomer present in polymer = <math>33750 \div 135 = 250</math> CAO</p> <p>Since each monomer has 4 carbon atoms, no. of carbon atoms in polymer = <math>250 \times 4 = 1000</math> CAO</p>	1 1
