Paper 3 Free Response

19 September 2017

2 hours

Candidates answer on separate paper.

Additional Materials:

- Answer Paper
- Cover Page
- Data Booklet

READ THESE INSTRUCTIONS FIRST

Write your name, class, centre number and index number on all the work you hand in.
Write in dark blue or black pen on both sides of paper.
You may use a soft pencil for any diagrams, graphs or rough working.
Do not use staples, paper clips, highlighters, glue or correction fluid.

Section A

Answer **all** questions.

Section B

Answer **one** question.

Begin each question on a fresh sheet of paper.
The use of an approved scientific calculator is expected, where appropriate.
A Data Booklet is provided. Do not write anything on it.
You are reminded of the need for good English and clear presentation in your answers.

The number of marks is given in brackets [] at the end of each question or part question.
At the end of the examination, fasten all your work securely together, with the cover page on top.

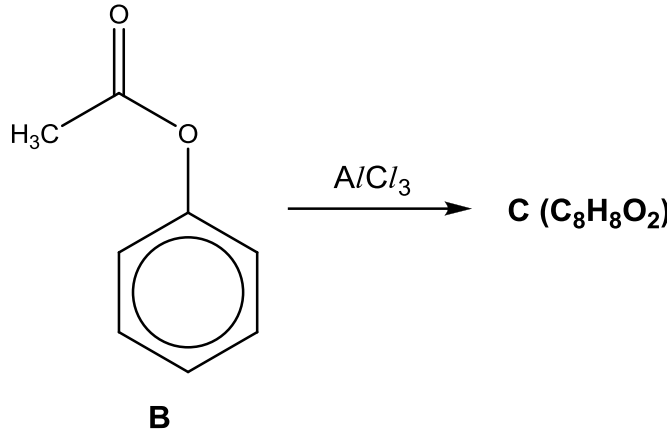

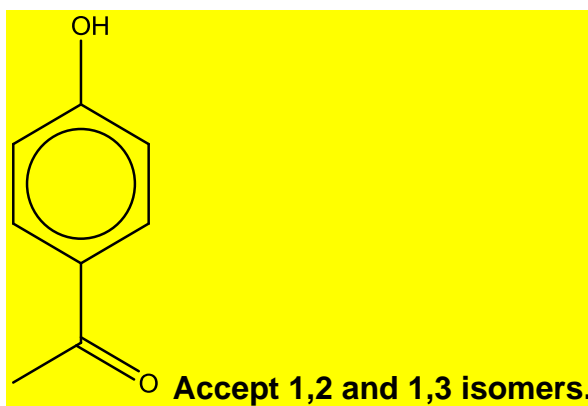

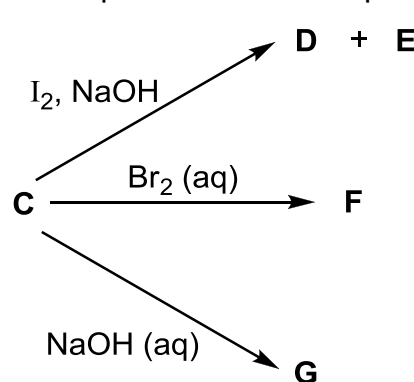

This document consists of **XX** printed pages.

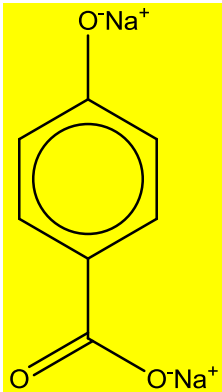

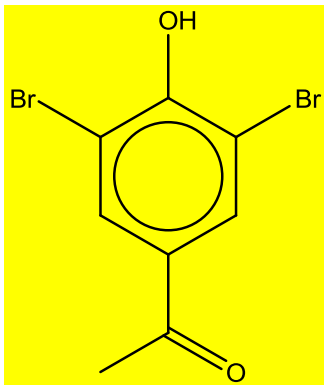

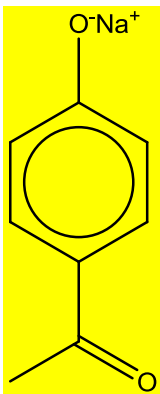

Section A

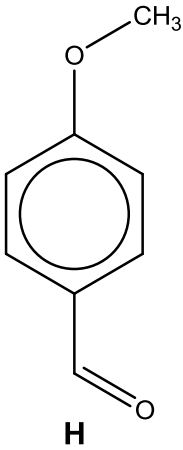

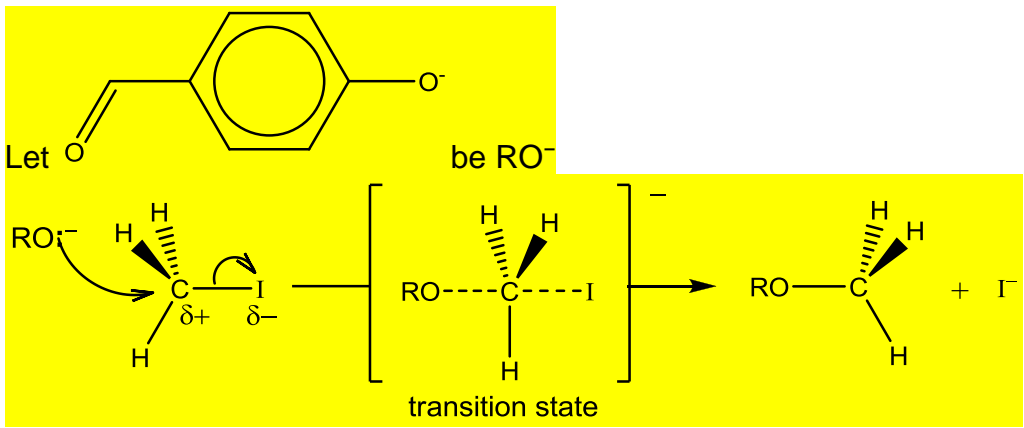

Answer **all** the questions in this section.

1	(a)	Under suitable conditions, SCl_2 reacts with water to produce a yellow solid and an acidic solution A . Solution A contains a mixture of $\text{SO}_2(\text{aq})$ and another compound.								
		(i)	State the oxidation number of S in SCl_2 .					[1]		
			+2							
		(ii)	Construct an equation for the reaction between SCl_2 and water.					[1]		
			$2\text{SCl}_2 + 2\text{H}_2\text{O} \rightarrow \text{S} + \text{SO}_2 + 4\text{HCl}$							
		(iii)	In the Contact Process, one important step is the conversion of SO_2 to SO_3 as shown below. $2\text{SO}_2(\text{g}) + \text{O}_2(\text{g}) \rightleftharpoons 2\text{SO}_3(\text{g})$ A 2.00 L flask was filled with 0.0400 mol SO_2 and 0.0200 mol O_2 . At equilibrium, the flask contained 0.0296 mol of SO_3 . Determine the value of K_c , stating its unit.					[3]		
				2SO_2	+	O_2	\rightleftharpoons	2SO_3		
			I / mol	0.04		0.02		0		
			C / mol	-0.0296		-0.0148		+0.0296		
			E / mol	0.0104		0.0052		0.0296		
			K_c $= \frac{[0.0296/2]^2}{[0.0104/2]^2 [0.0052/2]}$ $= 3116$ $= 3120 \text{ mol}^{-1} \text{ dm}^3$							

		(b)	During the electrolysis of dilute sulfuric acid using a current of 0.75 A for 90 min and platinum electrodes, the volume of oxygen gas collected was recorded and is shown in the Table 1.1 below. Table 1.1 <table><tr><th>Time / min</th><th>Volume of O₂ gas / cm³</th></tr><tr><td>20</td><td>55</td></tr><tr><td>40</td><td>110</td></tr><tr><td>60</td><td>165</td></tr><tr><td>80</td><td>220</td></tr></table>	Time / min	Volume of O ₂ gas / cm ³	20	55	40	110	60	165	80	220	
Time / min	Volume of O ₂ gas / cm ³													
20	55													
40	110													
60	165													
80	220													
		(i)	Plot a graph of volume of O ₂ gas over time. Use x axis: 2 cm for 10 min ; y axis: 2 cm for 50 cm ³	[2]										
			See graph paper											
		(ii)	Give equations for the reactions that occur at each electrode in the electrolysis of sulfuric acid.	[2]										
			Cathode: $2\text{H}_2\text{O}(\text{l}) + 2\text{e}^- \rightarrow \text{H}_2(\text{g}) + 2\text{OH}^-(\text{aq})$ Anode: $2\text{H}_2\text{O}(\text{l}) \rightarrow 4\text{H}^+(\text{aq}) + \text{O}_2(\text{g}) + 4\text{e}^-$											
		(iii)	On the same graph, draw and label a line (H ₂) to predict the volume of hydrogen that would be given off during the same experiment.	[1]										
			See graph paper. Each point is twice the value of graph in (ii).											
		(iv)	On the same graph, draw and label a line (O ₂) to predict the volume of oxygen that would be given off if a current of 0.3 A was used instead in the original experiment.	[1]										
			See graph paper. Each point is (3/7.5) the value of graph in (ii).											
		(v)	In a 2 nd experiment, the platinum electrodes were replaced with graphite electrodes. The volume of gas collected at the anode was 150 cm ³ while the volume of hydrogen gas collected was 220 cm ³ . The difference in volume of gas collected at the anode between the two experiments was due to production of CO gas at the anode. Calculate the volume of CO gas produced at the anode.	[2]										
			$\text{C} + \frac{1}{2} \text{O}_2 (\text{g}) \longrightarrow \text{CO} (\text{g})$ If no reaction with anode, volume of gas is 110 cm ³ Let volume of O ₂ reacted to form CO be x $110 - x + 2x = 150$ $x = 40 \text{ cm}^3$											

		$V_{CO} = 2(40) = 80 \text{ cm}^3$	
(c)	<p>About 100 years ago, in a reaction discovered by German chemist Karl Fries, compound B was converted into compound C when heated with $AlCl_3$.</p> <div style="text-align: center;">  <p>B</p> </div> <p>Compound C is a structural isomer of B. It is insoluble in water but dissolves in aqueous sodium hydroxide. It gives a yellow ppt with alkaline aqueous iodine and a white ppt with aqueous bromine.</p>		
(i)	Suggest the structure for compound C .	[1]	
	<div style="text-align: center;">  <p>Accept 1,2 and 1,3 isomers.</p> </div>		
	<p>The various reactions of compound C can be represented as follows:</p> <div style="text-align: center;">  </div>		

		(ii)	Suggest the structures for D to G .		[4]	
			CHI_3	D and E are interchangeable.		
		D	E			
						
		F	G			
		Accept 1,2- and 1,3 isomers for all.				
		Compound H , as shown below, is another structural isomer of B . It has a ether functional group whose general formula is $\text{R}-\text{O}-\text{R}'$. Compound H can be formed via a reaction between a substituted phenoxide ion and an alkyl halide molecule.				

				
		(iii)	Describe the mechanism when compound H is formed as described above.	[3]
				
		[Total: 21]		

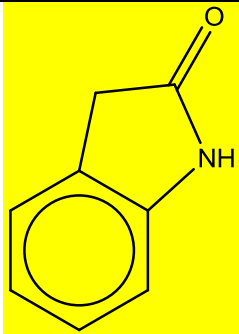

2	<p>In the late 1940s, Willard Libby developed the radiocarbon dating method for determining the age of an object containing organic material by using the properties of radiocarbon (^{14}C), a radioactive isotope of carbon. The principle of carbon dating is as such:</p> <p>During its life, a plant or animal is exchanging carbon with its surroundings, so the carbon it contains will have the same proportion of ^{14}C as the atmosphere. Once it dies, it ceases to acquire ^{14}C, but the ^{14}C within its biological material at that time will continue to decay, and so the ratio of ^{14}C to ^{12}C in its remains will gradually decrease.</p> <p>Because ^{14}C decays with first order kinetics, the proportion of radiocarbon can be used to determine how long it has been since a given sample stopped exchanging carbon – the older the sample, the less ^{14}C will be left.</p>	
---	--	--

	(a) A sample of carbon dioxide gas (that contained both $^{12}\text{CO}_2$ and $^{14}\text{CO}_2$) was analysed to determine the proportion of $^{14}\text{CO}_2$ found within. Analysis results showed that there is one $^{14}\text{CO}_2$ molecule for every 10^{12} CO_2 molecules.	
	(i) Calculate the number of $^{14}\text{CO}_2$ molecules in a 10.0 dm^3 carbon dioxide gas sample, measured under s.t.p.	[2]
	$\text{Number of moles of CO}_2 = \frac{10}{22.7}$ $= 0.441 \text{ mol}$ $\text{Number of } ^{14}\text{CO}_2 \text{ molecules} = 0.441 \times \frac{6.02 \times 10^{23}}{10^{12}}$ $= 2.65 \times 10^{11} \text{ molecules}$	
	(ii) Calculate the mass of $^{14}\text{CO}_2$ in the 10.0 dm^3 sample.	[1]
	$\text{Mass of } ^{14}\text{CO}_2 = \frac{2.65 \times 10^{11}}{6.02 \times 10^{23}} \times (14.0 + 16.0 \times 2)$ $= 2.03 \times 10^{-11} \text{ g}$	
	(iii) Hence, explain why it would be difficult to determine the proportion of $^{14}\text{CO}_2$ by means of mass measurement.	[1]
	The amount/mass of $^{14}\text{CO}_2$ is too small to be accurately measured.	
	(b) To more accurately determine the proportion of ^{14}C in a sample of graphite, the graphite is vaporised and ionised to $\text{C}^+(\text{g})$ ions. These ions were then passed through 2 electric plates. Given that H^+ is deflected with an angle of 8.4° , what is the angle of deflection for $^{14}\text{C}^+$ ions under the same experimental set-up?	[1]
	$^{14}\text{C}^+$ deflected by $\left(\frac{1}{14}\right) (8.4) = 0.60^\circ$	
	(c) The half-life of ^{14}C is 5730 years. Determine the time that has elapsed for a piece of wood from a dead tree to contain 30.0% of its original ^{14}C .	[2]
	<p>Let the number of half-life be n</p> $\frac{30.0}{100} = \left(\frac{1}{2}\right)^n$ $n = \frac{\lg\left(\frac{30.0}{100}\right)}{\lg\left(\frac{1}{2}\right)}$ $n = 1.74 \text{ [1]}$ <p>Time taken = $5730 \times 1.74 = \underline{9970 \text{ years}}$</p>	
	(d) The age of crude oil is far older than what could be determined from radiocarbon dating.	

		<p>To measure the age of a crude oil sample, a method involving the measurement of the relative amount of oleanane is used instead.</p>  <p>Oleanane</p>		
		(i)	What is the number of chiral carbons in an oleanane molecule?	[1]
			8	
		(ii)	<p>Free radical substitution of oleanane with Cl_2 produces a mixture of various products.</p> <p>Given that tertiary hydrogen atoms are the most reactive towards free radical substitution, suggest the structures of two possible mono-chlorinated oleanane which are formed in high proportions.</p>	[2]
				

	(e)	<p>Benzene is obtained from the fractional distillation of crude oil. It can be converted to a series of different useful chemicals such as phenylamine. The formation of phenylamine involves the direct reaction of nitrobenzene and hydrogen gas in the presence of a heterogeneous catalyst.</p> <p>A series of experiments were carried out at a specific temperature to investigate the kinetics of this reaction:</p> <table border="1"> <thead> <tr> <th>Experiment</th><th>[nitrobenzene] / mol dm⁻³</th><th>[H₂] / mol dm⁻³</th><th>Initial rate / mol dm⁻³ s⁻¹</th></tr> </thead> <tbody> <tr> <td>1</td><td>0.010</td><td>0.010</td><td>4.50 × 10⁻⁵</td></tr> <tr> <td>2</td><td>0.015</td><td>0.010</td><td>6.74 × 10⁻⁵</td></tr> <tr> <td>3</td><td>0.020</td><td>0.020</td><td>1.80 × 10⁻⁴</td></tr> <tr> <td>4</td><td>0.030</td><td><i>x</i></td><td>4.05 × 10⁻⁴</td></tr> </tbody> </table>	Experiment	[nitrobenzene] / mol dm ⁻³	[H ₂] / mol dm ⁻³	Initial rate / mol dm ⁻³ s ⁻¹	1	0.010	0.010	4.50 × 10 ⁻⁵	2	0.015	0.010	6.74 × 10 ⁻⁵	3	0.020	0.020	1.80 × 10 ⁻⁴	4	0.030	<i>x</i>	4.05 × 10 ⁻⁴	
Experiment	[nitrobenzene] / mol dm ⁻³	[H ₂] / mol dm ⁻³	Initial rate / mol dm ⁻³ s ⁻¹																				
1	0.010	0.010	4.50 × 10 ⁻⁵																				
2	0.015	0.010	6.74 × 10 ⁻⁵																				
3	0.020	0.020	1.80 × 10 ⁻⁴																				
4	0.030	<i>x</i>	4.05 × 10 ⁻⁴																				
	(i)	Define the term <i>heterogeneous catalyst</i> .	[2]																				
		A catalyst is a substance that <u>increases the rate of reaction</u> by providing an <u>alternative reaction pathway of lowered activation energy</u> , and is <u>regenerated at the end of the reaction</u> . A heterogeneous catalyst is one that is <u>not in the same phase</u> as the reactants.																					
	(ii)	Determine the order of reaction with respect to nitrobenzene and hydrogen.	[2]																				
		<p>Comparing experiment 1 and 2, when [nitrobenzene] is increased to 1.5 times, the reaction rate is increased to 1.5 times. Hence, it is first order with respect to nitrobenzene.</p> <p>Let the rate equation be: Rate = k[nitrobenzene][H₂]^a</p> <p>Comparing experiment 2 and 3:</p> $\frac{6.74 \times 10^{-5}}{1.80 \times 10^{-4}} = \frac{k(0.015)(0.01)^a}{k(0.02)(0.02)^a}$ $\left(\frac{6.74 \times 10^{-5}}{1.80 \times 10^{-4}}\right) \left(\frac{0.02}{0.015}\right) = \left(\frac{0.01}{0.02}\right)^a$ <p>a = 1</p>																					
	(iii)	Calculate the rate constant, stating its units.	[1]																				
		Using experiment 1:																					

			$4.50 \times 10^{-5} = k(0.01)(0.01)$ $k = 0.450 \text{ mol}^{-1} \text{ dm}^3 \text{ s}^{-1}$	
		(iv)	Hence, determine the value of x .	[1]
			$4.05 \times 10^{-4} = (0.45)(0.03)x$ $x = 0.0300 \text{ (mol dm}^{-3}\text{)}$	
	(f)	Benzene is made to undergo a series of reactions as shown: <div style="text-align: center; margin-top: 10px;"> </div>		
		(i)	Suggest the structures of J and K .	[2]
			J: K:	
		(ii)	Given that compound L is neutral, suggest the reagent used in the final step and the structure of L .	[2]
			PCl₅ or SOCl₂ Structure of L:	

				
		[Total: 20]		

3	Chromium is a transition metal commonly found in the earth's crust. It is usually mined as chromite.																					
	<table><tr><td>Period 4 Element</td><td>Ti</td><td>V</td><td>Cr</td><td>Mn</td><td>Fe</td><td>Co</td><td>Ni</td><td>Cu</td></tr><tr><td>Atomic radius / nm</td><td>0.132</td><td>0.122</td><td>0.117</td><td>0.117</td><td>0.116</td><td>0.116</td><td>0.115</td><td>0.117</td></tr></table>			Period 4 Element	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Atomic radius / nm	0.132	0.122	0.117	0.117	0.116	0.116	0.115	0.117	
Period 4 Element	Ti	V	Cr	Mn	Fe	Co	Ni	Cu														
Atomic radius / nm	0.132	0.122	0.117	0.117	0.116	0.116	0.115	0.117														
	(a)	Explain why the atomic radius for transition elements remains relatively constant.		[2]																		
		<p>Across the transition elements, <u>nuclear charge increases but screening effect also increases</u> due to <u>electrons added to the inner 3d subshell</u>. Therefore, the effective nuclear charge is approximately the same. The <u>attraction between the nucleus and the valence electrons remain about the same</u>. Thus, atomic radius remains almost constant.</p>																				
	(b)	(i)	Write the electronic configuration for Cr ³⁺ ion.	[1]																		
			Cr ³⁺ : 1s ² 2s ² 2p ⁶ 3s ² 3p ⁶ 3d ³																			
		(ii)	<p>Chromium forms octahedral complexes with the general formula CrCl₃.6H₂O. One of them dissolves in water to form a violet solution which turned green upon warming. An excess of aqueous silver nitrate was added separately to solutions containing 0.0100 mol of each complex. The violet complex gave 1.50 g of precipitate, while the green complex gave 4.40 g of precipitate.</p> <p>Deduce the formulae of the two complex ions.</p>	[3]																		

			Write the equation for the conversion of the violet complex to the green complex.	
			<p>Amt of chloride from the green complex = $4.40 / 143.5$ $= 0.0306 \text{ mol}$</p> <p>Ratio of chloride: complex = 3:1</p> <p>Formula of green complex: $[\text{Cr}(\text{H}_2\text{O})_6]^{3+}$</p> <p>Amt of chloride from violet complex = $1.50 / 143.5 = 0.0105 \text{ mol}$</p> <p>Ratio of chloride : complex = 1:1</p> <p>Formula of violet complex: $[\text{Cr}(\text{H}_2\text{O})_4(\text{Cl})_2]^+$</p> <p>$[\text{Cr}(\text{H}_2\text{O})_4(\text{Cl})_2]^+(\text{aq}) + 2\text{H}_2\text{O}(\text{l}) \rightarrow [\text{Cr}(\text{H}_2\text{O})_6]^{3+}(\text{aq}) + 2 \text{Cl}^-(\text{l})$</p>	
		(iii)	<p>Using the Cartesian axes, like those shown below,</p>  <p>draw fully-labelled diagrams of the following :</p> <ul style="list-style-type: none"> • One of the d orbital at the lower energy level in an octahedral complex. Label this diagram "Lower energy level". • One of the d orbital at the upper energy level in an octahedral complex. Label this diagram "Upper energy level". 	[2]

		<p style="text-align: center;">[EDTA]⁴⁻</p>		
	(i)	Suggest the reagents and conditions in steps I, II and III.	[3]	
		<p>Step I : HCN with small amount of NaCN</p> <p>Step II : PCl₅/PCl₃/SOCl₂</p> <p>Step III : H₂SO₄(aq) heat under reflux</p>		
	(ii)	Draw the displayed formulae of intermediates Q and R .	[2]	
		<p style="text-align: center;">Q R</p>		
	(iii)	<p>State the type of reaction when T is converted to [EDTA]⁴⁻.</p> <p>Give a reason why a limited amount of 1,2-diaminoethane is used.</p>	[2]	
		<p>Nucleophilic substitution</p> <p>To enable multiple substitution on the amine group.</p>		
	(iv)	Define the term <i>ligand</i> . State the number of coordinate bonds that a [EDTA] ⁴⁻ ligand can form with a central metal ion.	[2]	

			<p>A ligand is an ion or molecule which contains at least one atom bearing a lone pair of electrons which can be donated into the low-lying vacant orbital of the central metal atom or ion forming a co-ordinate (dative) bond.</p> <p>6 coordinate bonds.</p>	
			[Total: 19]	

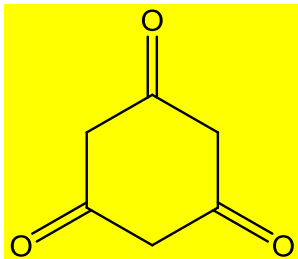

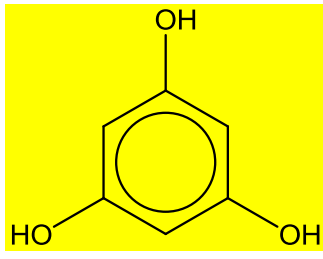

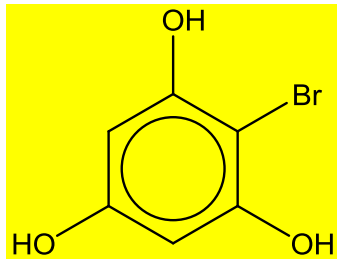

Section B

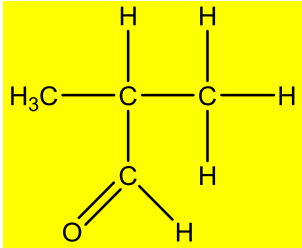

Answer **one** question from this section.

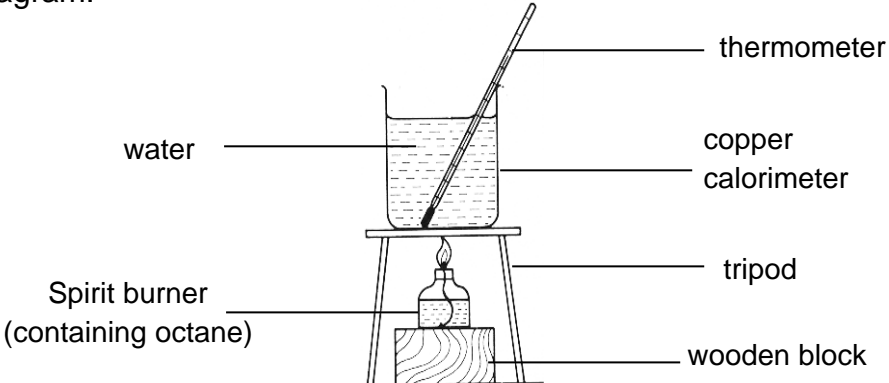

4	This question concerns the chemistry of the oxides of some elements.			
	(a)	<p>The oxides of Period 3 show different reactions with water. Describe the reactions, if any, of the oxides SiO₂ and SO₃ with water. Include the approximate pH value of any resulting solutions, and write equations for any reactions that occur.</p>		[3]
		<p>SiO₂ <u>does not react with water/is insoluble</u> in water. Hence, pH remains at 7.</p> <p>SO₃ <u>reacts/hydrolyse</u> with water to give <u>acidic solutions (pH = 2)</u>.</p> <p><u>SO₃(l) + H₂O(l) → H₂SO₄(aq)</u></p>		
	(b)	Carbon combusts in oxygen to form two common oxides, CO and CO ₂ . These oxides are also formed when solid magnesium oxalate, MgC ₂ O ₄ , is heated strongly.		

		(i)	Write an equation, with state symbols, to represent the thermal decomposition of solid magnesium oxalate.	[1]																					
			$\text{MgC}_2\text{O}_4(\text{s}) \rightarrow \text{MgO}(\text{s}) + \text{CO}_2(\text{g}) + \text{CO}(\text{g})$																						
		(ii)	Explain why magnesium oxalate decomposes at a lower temperature than barium oxalate, BaC_2O_4 .	[2]																					
			Mg^{2+} is <u>smaller/has a smaller ionic radius</u> and has a <u>higher charge density</u> , and hence a <u>greater polarising power</u> , than Ba^{2+} . It <u>weakens the bonds in the $\text{C}_2\text{O}_4^{2-}$ anion to a greater extent</u> and hence MgC_2O_4 is less thermally stable.																						
		Carbon also forms compounds with other Group 16 elements like sulfur and selenium. The properties of some of these compounds, along with CO_2 , are given in Table 4.1. Table 4.1 <table><tr><th>Compound</th><th>Structure</th><th>Dipole moment</th><th>Boiling point / °C</th></tr><tr><td>CO_2</td><td>$\text{O}=\text{C}=\text{O}$</td><td>0</td><td>sublimes</td></tr><tr><td>CS_2</td><td>$\text{S}=\text{C}=\text{S}$</td><td>0</td><td>46</td></tr><tr><td>COS</td><td>$\text{S}=\text{C}=\text{O}$</td><td>0.71</td><td>-50</td></tr><tr><td>COSe</td><td>$\text{Se}=\text{C}=\text{O}$</td><td>0.73</td><td>-22</td></tr></table>			Compound	Structure	Dipole moment	Boiling point / °C	CO_2	$\text{O}=\text{C}=\text{O}$	0	sublimes	CS_2	$\text{S}=\text{C}=\text{S}$	0	46	COS	$\text{S}=\text{C}=\text{O}$	0.71	-50	COSe	$\text{Se}=\text{C}=\text{O}$	0.73	-22	
Compound	Structure	Dipole moment	Boiling point / °C																						
CO_2	$\text{O}=\text{C}=\text{O}$	0	sublimes																						
CS_2	$\text{S}=\text{C}=\text{S}$	0	46																						
COS	$\text{S}=\text{C}=\text{O}$	0.71	-50																						
COSe	$\text{Se}=\text{C}=\text{O}$	0.73	-22																						
		(iii)	Explain, in terms of structure and bonding, the difference in the boiling point of CS_2 and COS .	[2]																					
			Both CS_2 and COS have <u>simple molecular structures</u> . CS_2 has a <u>larger number of electrons</u> (or larger electron cloud) than COS . More energy is required to overcome the <u>stronger instantaneous dipole-induced dipole interactions between CS_2 molecules</u> than the <u>permanent dipole-induced dipole interactions between COS molecules</u> . Hence, CS_2 has a higher boiling point.																						
		(iv)	Explain why <ul style="list-style-type: none">CO_2 has no overall dipole moment.COSe has a greater dipole moment than COS.	[2]																					
			<ul style="list-style-type: none">CO_2 is <u>linear</u> and hence the <u>dipoles cancel out</u>.<u>$\text{C}=\text{S}$ bond is more polar than $\text{C}=\text{Se}$</u> (since S is more electronegative than Se). There is smaller difference between																						

			the dipole moment of C=O and C=S than that between C=O and C=Se.									
	(c)	Aside from the common oxides, carbon forms a series of reactive oxocarbons. One such compound is tricarbon monoxide, C ₃ O, a reactive molecule found in space.										
		(i)	Suggest a structure of tricarbon monoxide. Indicate clearly any lone pairs present.	[1]								
			:C=C=C=Ö:									
		Tricarbon monoxide is isoelectronic to cyanogen, (CN) ₂ . The molecule of cyanogen contains a C–C single bond.										
		(ii)	Draw the dot-and-cross diagram of cyanogen. In your diagram, you should distinguish the electrons originating from each of the two carbon atoms and those from the two nitrogen atoms.	[1]								
		(iii)	Suggest the shapes of tricarbon monoxide and cyanogen.	[1]								
			They are both <u>linear</u> .									
	(d)	<p>Another oxycarbon is pentacarbon dioxide, C₅O₂. It can be obtained by heating compound X, C₆H₆O₃, at a high temperature. X exists in equilibrium with its isomer, Y.</p> <p>X does not react with aqueous bromine. X also gives an orange precipitate with 2,4-DNPH but does not give a silver mirror with Tollens' reagent. When reacted with limited bromine under ultraviolet light, X produced only one mono-brominated compound.</p> <p>Y reacts with dilute nitric acid to form only one mono-nitrated compound, Z.</p> <p>Suggest the structures of compounds X, Y and Z. Explain your reasoning.</p>		[7]								
		<table><tr><th>Information/Reaction</th><th>Deduction</th></tr><tr><td>X/Y has <u>C:H ratio of 1:1</u></td><td>X/Y might contain a <u>benzene ring</u>.</td></tr><tr><td>X does not undergo <u>electrophilic substitution</u> nor <u>electrophilic addition</u> with Br₂(aq)</td><td>X does not contain a phenol nor a C=C.</td></tr><tr><td>X undergoes <u>condensation</u> with 2,4-DNPH but does not undergo <u>oxidation</u> with Tollens' reagent.</td><td>X is a <u>ketone</u>.</td></tr></table>		Information/Reaction	Deduction	X/Y has <u>C:H ratio of 1:1</u>	X/Y might contain a <u>benzene ring</u> . 5	(a)	<p>Hydroformylation is an industrial process for the formation of aldehydes from alkenes.</p> $ \begin{array}{c} \text{H} \\ \\ \text{H}_3\text{C}-\text{C}=\text{CH}_2 \end{array} + \text{CO} + \text{H}_2 \rightleftharpoons \begin{array}{c} \text{H} \quad \text{H} \\ \quad \\ \text{H}_3\text{C}-\text{C}-\text{C}-\text{C}=\text{O} \\ \quad \\ \text{H} \quad \text{H} \end{array} $ <p style="text-align: center;">propene butanal</p>			
	(i)	<p>Determine the oxidation numbers of carbon-1, carbon-2 and carbon-4 in butanal.</p>			[1]
		<p>C1: +1 C2: -2 C4: -3</p>			
	(ii)	<p>The hydroformylation of propene can result in the formation of two isomeric products. Given that the mechanism of hydroformylation resembles the electrophilic addition of alkenes, suggest the structure of the other isomer apart from butanal.</p>			[1]

														
		(iii)	Write the K_p expression for the reaction above, stating its units.	[1]										
			$K_p = \frac{P_{\text{CH}_3\text{CH}_2\text{CH}_2\text{CHO}}}{P_{\text{CH}_3\text{CH}=\text{CH}_2} P_{\text{CO}} P_{\text{H}_2}}$ Units: $\text{atm}^{-2} / \text{Pa}^{-2}$											
		(iv)	<p>When an equimolar mixture of propene, CO and H_2 at an initial pressure of 120 atm was allowed to reach equilibrium at 550 K, the partial pressure of butanal was found to be 38.5 atm.</p> <p>Calculate a value of K_p at 550 K.</p>	[2]										
			$\text{C}_3\text{H}_6 + \text{CO} + \text{H}_2 \rightleftharpoons \text{CH}_3\text{CH}_2\text{CH}_2\text{CHO}$ <table border="0" style="width: 100%;"> <tr> <td>Initial partial pressure / Pa</td> <td>40</td> <td>40</td> <td>40</td> <td>0</td> </tr> <tr> <td>Eqm partial pressure / Pa</td> <td>40–38.5 = 1.5</td> <td>40–38.5 = 1.5</td> <td>40–38.5 = 1.5</td> <td>38.5</td> </tr> </table> $K_p = \frac{38.5}{1.5 \times 1.5 \times 1.5} = 11.4 \text{ Pa}^{-2}$	Initial partial pressure / Pa	40	40	40	0	Eqm partial pressure / Pa	40–38.5 = 1.5	40–38.5 = 1.5	40–38.5 = 1.5	38.5	
Initial partial pressure / Pa	40	40	40	0										
Eqm partial pressure / Pa	40–38.5 = 1.5	40–38.5 = 1.5	40–38.5 = 1.5	38.5										
		(v)	Hence, predict the sign of ΔG for the reaction. Explain your reasoning taking into account the thermodynamic considerations of the reaction.	[2]										
			ΔG is negative due to K_p is large (greater than 1) and position of equilibrium lies very much to the right.											
	(b)		Other important use of hydrocarbons include fuels, plastics, paints and solvents. In some countries, where crude oil is either scarce or expensive, biofuels such as ethanol are also increasingly being used for fuels instead of hydrocarbons.											

		<p>(i)</p> <p>James carried out an experiment to determine the enthalpy change of combustion of octane, C_8H_{18}, using the apparatus shown in the diagram.</p> <div></div> <p>These are the results that James obtained:</p> <p>Volume of water = 1000 cm^3</p> <p>Initial temperature of water = $29.6\text{ }^\circ\text{C}$</p> <p>Highest temperature of water = $50.0\text{ }^\circ\text{C}$</p> <p>Initial mass of burner and octane = 59.35 g</p> <p>Final mass of burner and octane = 53.77 g</p> <p>Heat capacity of calorimeter = 770 J K^{-1}</p> <p>Use these results and data from the <i>Data Booklet</i> to determine the experimental enthalpy change of combustion of octane.</p>										
		<p>Heat evolved = $1000 \times 4.18 \times 20.4 + 770 \times 20.4 = 101000\text{ J}$</p> <p>Amount of octane reacted = $\frac{59.35 - 53.77}{8 \times 12.0 + 18 \times 1.0} = 4.89 \times 10^{-2}\text{ mol}$</p> <p>Enthalpy change of combustion of octane = $-\frac{101000}{4.89 \times 10^{-2}}$</p> <p>$= -2060\text{ kJ mol}^{-1}$</p>										
		<p>(ii)</p> <p>The accurate experimental enthalpy change of combustion of three hydrocarbons are given in Table 5.1.</p> <p style="text-align: center;">Table 5.1</p> <table><tr><td>Alkane</td><td>Formula</td><td>$\Delta H_c/\text{kJ mol}^{-1}$</td></tr><tr><td>Heptane</td><td>C_7H_{16}</td><td>-4817</td></tr><tr><td>Octane</td><td>C_8H_{18}</td><td>-5470</td></tr></table>	Alkane	Formula	$\Delta H_c/\text{kJ mol}^{-1}$	Heptane	C_7H_{16}	-4817	Octane	C_8H_{18}	-5470	
Alkane	Formula	$\Delta H_c/\text{kJ mol}^{-1}$										
Heptane	C_7H_{16}	-4817										
Octane	C_8H_{18}	-5470										

			Nonane	C ₉ H ₂₀	-6125		
			Suggest what the regular increase in the values of ΔH _c given in the table represents.				
			The regular increase in the ΔH _c (~650kJ mol ⁻¹) is due to the combustion of the -CH ₂ - group.				
		(iii)	Draw a pair of enantiomers of heptane.				[1]
							
		(iv)	Alkanes are also used in dry cleaning of clothing and textiles. Dry cleaning involves soaking the clothes in a solvent other than water. Recently, the use of supercritical carbon dioxide as a dry cleaning solvent has also been gaining popularity. Supercritical carbon dioxide is a fluid state of carbon dioxide which is maintained at or above its critical temperature. Suggest two possible reasons why supercritical carbon dioxide is a better solvent than organic solvents like hexane.				[2]
			CO ₂ is: <ul style="list-style-type: none">• cheap• non-flammable• readily available• easily vaporised under low pressure/high temperature• safe/non-toxic.• odourless				
		(c)	Many modern methods of chemical analysis rely on the use of sophisticated instruments. For many years, scientists relied on traditional laboratory apparatus for chemical analysis. Many qualitative tests and some volumetric analysis used depended on an application of the principles of solubility product. Data for use in this question are given in Table 5.2. Table 5.2				

			Colour	Solubility/ mol dm ⁻³	K _{sp} (25 °C)		
		AgCl	White	1.42 × 10 ⁻⁵	2.02 × 10 ⁻¹⁰		
		AgI	Yellow	8.95 × 10 ⁻⁹	8.01 × 10 ⁻¹⁷		
		Ag ₂ CrO ₄	Red	9.10 × 10 ⁻⁵	3.01 × 10 ⁻¹²		
		(i)	Aqueous AgNO ₃ is added to solutions containing 0.100 mol dm ⁻³ Cl ⁻ (aq) or 0.0100 mol dm ⁻³ CrO ₄ ²⁻ (aq). What concentration of Ag ⁺ must be present to cause the precipitation of I: AgCl II: Ag ₂ CrO ₄ ?				[2]
			I: $[Ag^+] = \frac{2.02 \times 10^{-10}}{0.1} = 2.02 \times 10^{-9} \text{ mol dm}^{-3}$ II: $[Ag^+] = \sqrt{\frac{3.01 \times 10^{-12}}{0.01}} = 1.73 \times 10^{-5} \text{ mol dm}^{-3}$				
		(ii)	Standard solutions of silver nitrate can be used in volumetric analysis to determine the concentration of chloride ions in a sample of water. When the titration is carried out, AgNO ₃ (aq) of known concentration is added slowly to the solution that contains Cl ⁻ ions. A small quantity of aqueous potassium chromate(VI), K ₂ CrO ₄ (0.01 mol dm ⁻³) is also added as an indicator. Using the data given in Table 5.2 and your answers in (c)(i), predict using calculations what you would see at the beginning of the titration and at the end-point and explain why K ₂ CrO ₄ (aq) can be used as an indicator in this titration.				[4]
			At the beginning, a white ppt AgCl is observed At the end point, a red ppt of Ag ₂ CrO ₄ is observed When all AgCl is precipitated, $[Ag^+] = 1.42 \times 10^{-5}$ when IP of Ag ₂ CrO ₄ = $[Ag^+]^2[CrO_4^{2-}] = (1.42 \times 10^{-5})^2(0.01) = 2.02 \times 10^{-12}$ which is lower than K _{sp} of Ag ₂ CrO ₄ . So, at the end point, Ag ₂ CrO ₄ only precipitates when all AgCl has precipitated.
