Question	Answer	Marks
1(a)(i)	The gravitational potential at a point in a gravitational field is the work done per unit mass by an external agent in bringing a small point mass from infinity to that point in the field at constant speed.	A2
1(a)(ii)	Gravitational force is <b>attractive</b> in nature and the <b>potential is set to be zero at infinity</b> .  To move a mass from infinity to a point in the field (of the source mass), <b>the force exerted on the mass by the external agent will be in opposite direction to the displacement of the mass</b> . Thus negative work is done by the external force (agent).	A1 A1
1(b)(i)	During the path AC, the gravitational force is directed towards A and is <b>weakening</b> .  Gravitational force is <b>zero at C</b> .	A1 A1
1(b)(ii)	  1m for $KE_B < KE_A$ 1m for minimum point at C	A2
