(b)(i)	<p>Silicon oxide is a giant molecule with strong covalent bonds between Si and O atoms.</p> <p>Silicon chloride exists as simple covalent molecules with weak van der Waals' forces between its molecules.</p> <p>More energy is needed to break the covalent bonds than the van der Waals forces, hence silicon oxide has a much higher melting point.</p>
(ii)	<p>The decrease in bond angles is explained by the <b>decreasing electronegativity</b> going down the group from oxygen to selenium.</p> <p>As electronegativity decreases, the <b>bonding pair of electrons are less attracted to the central atom</b>. This results in <b>decrease in repulsion between the bond pairs</b> and hence a <b>smaller bond angle</b>.</p>
