## JC 2 PRELIMINARY EXAMINATION

CANDIDATE  
NAME

CLASS

DATE

## H2 CHEMISTRY

**9729/04**

### Paper 4 Practical Paper

**22 August 2023**  
2 hours 30 minutes

Candidates answer on question paper.  
No Additional Materials are required

### READ THESE INSTRUCTIONS FIRST

Write your name and class in the spaces at the top of this page.

Give details of the practical shift and laboratory where appropriate, in the boxes provided.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

Answer **all** questions in the spaces provided on the Question Paper.

The use of an approved scientific calculator is expected, where appropriate.

You may lose marks if you do not show your working or if you do not use appropriate units.

Qualitative Analysis Notes are printed on pages 19 and 20.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

<b>Shift</b>
<b>Laboratory</b>

For Examiner's use	
<b>1</b>	13
<b>2</b>	18
<b>3</b>	12
<b>4</b>	12
<b>Total</b>	55

Answer **all** the questions in the spaces provided.

## 1 Determination of enthalpy change of reaction

**FA 1** is solid sodium hydrogencarbonate,  $\text{NaHCO}_3$ .

**FA 2** is  $2.00 \text{ mol dm}^{-3}$  hydrochloric acid,  $\text{HCl}$ .

The molar enthalpy change of reaction of solid sodium hydrogencarbonate with hydrochloric acid in equation 1 is the enthalpy change when one mole of solid sodium hydrogencarbonate reacts with excess hydrochloric acid.

The molar enthalpy change of reaction of sodium carbonate with hydrochloric acid in equation 2 is the enthalpy change when one mole of sodium carbonate reacts with excess hydrochloric acid.

You are to perform an experiment by which you will determine the enthalpy change  $\Delta H_{\text{r}}(\text{NaHCO}_3(\text{s}))$ . You will also determine the enthalpy change  $\Delta H_{\text{r}}(\text{Na}_2\text{CO}_3(\text{s}))$  using the data provided. You will then use your results in a Hess' Law calculation to determine the enthalpy change,  $\Delta H$ , for the reaction of sodium carbonate,  $\text{Na}_2\text{CO}_3$ , with water and carbon dioxide to form sodium hydrogencarbonate,  $\text{NaHCO}_3$ , as shown in equation 3.

- (a) Follow the instructions below to determine the maximum temperature change when a known mass of solid sodium hydrogencarbonate, **FA 1**, reacts with hydrochloric acid.

In an appropriate format in the space provided below, record

- all weighings to an appropriate level of precision,
- all values of temperature to an appropriate level of precision.

### Procedure

1. Weigh the capped bottle containing **FA 1**.
2. Place one polystyrene cup inside a second polystyrene cup. Place these in a glass beaker to prevent them from tipping over.
3. Use a measuring cylinder to transfer  $25.0 \text{ cm}^3$  of the acid, **FA 2**, into the first polystyrene cup.
4. Stir the solution in the cup with the thermometer. Read and record its temperature.
5. Transfer all the **FA 1** to the polystyrene cup. Stir the mixture.

Note: This reaction is very vigorous. Be careful when you pour in the solid. Minimise inhalation of gas produced.

6. Continue to stir the mixture. Observe the temperature and record the value that shows

the maximum change from the initial temperature.

7. Reweigh the empty bottle and its cap.

Determine the maximum temperature change and the mass of **FA 1** used.

### Results

mass of capped bottle and <b>FA 1</b> / g	7.868
mass of capped bottle and residual <b>FA 1</b> / g	5.408
mass of <b>FA 1</b> used / g	2.460

initial temperature / °C	31.6
lowest temperature reached / °C	24.2
decrease in temperature / maximum change in temperature / °C	7.4

[4]

<b>(b)</b>	In the following calculations, you should assume that the specific heat capacity of the solution is $4.18 \text{ J g}^{-1} \text{ K}^{-1}$ , and the density of the solution is $1.00 \text{ g cm}^{-3}$ .	
	<b>(i)</b>	Use your results from <b>1(a)</b> to calculate the heat change for your experiment.
		$\begin{aligned} \text{Heat change (q}_1\text{)} &= mc\Delta T \\ &= (25 \times 1.00) \times 4.18 \times (7.4) \\ &= 773.3 \text{ J} \\ &= 773 \text{ J} \quad \text{or} \quad 0.773 \text{ kJ} \end{aligned}$ <p style="text-align: right;">Heat change = ..... [1]</p>
	<b>(ii)</b>	<p>Hence, determine a value for <math>\Delta H_r(\text{NaHCO}_3(\text{s}))</math>.</p> <p>Include the sign of <math>\Delta H_r(\text{NaHCO}_3(\text{s}))</math> in your answer.</p> <p>[<math>A_r</math>: H, 1.0; C, 12.0; O, 16.0; Na, 23.0]</p>
		$\begin{aligned} n(\text{NaHCO}_3) &= 2.460 \div 84 \\ &= 0.029286 \text{ mol} \end{aligned}$ $\begin{aligned} \Delta H_r(\text{NaHCO}_3(\text{s})) &= + (q_1) \div n(\text{NaHCO}_3) \\ &= + 773.3 \div 0.029286 \\ &= + 26405 \text{ J mol}^{-1} \\ &= + 26400 \text{ J mol}^{-1} \quad \text{or} \quad + 26.4 \text{ kJ mol}^{-1} \end{aligned}$

		$\Delta H_r(\text{NaHCO}_3(\text{s})) = \dots\dots\dots [1]$								
	(iii)	<p>The results of an experiment where sodium carbonate, <math>\text{Na}_2\text{CO}_3(\text{s})</math>, was reacted completely with an excess of dilute hydrochloric acid, <b>FA 2</b>, are shown in Table 1.1.</p> <p style="text-align: center;"><b>Table 1.1</b></p> <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>mass of <math>\text{Na}_2\text{CO}_3(\text{s})</math> used / g</td> <td>5.235</td> </tr> <tr> <td>volume of <b>FA 2</b> used / <math>\text{cm}^3</math></td> <td>50.0</td> </tr> <tr> <td>initial temperature of <b>FA 2</b> / <math>^\circ\text{C}</math></td> <td>33.5</td> </tr> <tr> <td>maximum temperature reached / <math>^\circ\text{C}</math></td> <td>41.8</td> </tr> </table>	mass of $\text{Na}_2\text{CO}_3(\text{s})$ used / g	5.235	volume of <b>FA 2</b> used / $\text{cm}^3$	50.0	initial temperature of <b>FA 2</b> / $^\circ\text{C}$	33.5	maximum temperature reached / $^\circ\text{C}$	41.8
mass of $\text{Na}_2\text{CO}_3(\text{s})$ used / g	5.235									
volume of <b>FA 2</b> used / $\text{cm}^3$	50.0									
initial temperature of <b>FA 2</b> / $^\circ\text{C}$	33.5									
maximum temperature reached / $^\circ\text{C}$	41.8									
		<p>Use the results given in Table 1.1 to calculate a value for <math>\Delta H_r(\text{Na}_2\text{CO}_3(\text{s}))</math>.</p> <p>[A<sub>r</sub>: C, 12.0; O, 16.0; Na, 23.0]</p> <p>Heat change (<math>q_2</math>) = <math>mc\Delta T</math>  <math>= (50) \times 1.00 \times 4.18 \times (41.8 - 33.5)</math>  <math>= 1734.7 \text{ J}</math></p> <p><math>n(\text{Na}_2\text{CO}_3(\text{s})) = 5.235 \div 106 = 0.049387 \text{ mol}</math></p> <p><math>\Delta H_r(\text{Na}_2\text{CO}_3(\text{s})) = - (1734.7) \div (0.049387)</math>  <math>= -35125 \text{ J mol}^{-1}</math>  <math>= -35100 \text{ J mol}^{-1} \quad \text{or} \quad -35.1 \text{ kJ mol}^{-1}</math></p> <p style="text-align: right;"><math>\Delta H_r(\text{Na}_2\text{CO}_3(\text{s})) = \dots\dots\dots [2]</math></p>								
	(iv)	<p>Use your answers from <b>1(b)(ii)</b> and <b>1(b)(iii)</b> and the equations 1 and 2 to determine the enthalpy change for the following reaction, <math>\Delta H</math>. Show your working clearly.</p> <p style="text-align: center;"><math>\text{Na}_2\text{CO}_3(\text{s}) + \text{H}_2\text{O}(\text{l}) + \text{CO}_2(\text{g}) \rightarrow 2\text{NaHCO}_3(\text{s}) \quad \Delta H</math></p> <p>If you are not able to determine a value for <b>1(b)(ii)</b> and/or <b>1(b)(iii)</b>, you may use <math>x</math> and <math>y</math> to represent the respective enthalpy changes and proceed with this part of the question.</p>								

		$\text{Na}_2\text{CO}_3(\text{s}) + \text{H}_2\text{O}(\text{l}) + \text{CO}_2(\text{g}) \xrightarrow{\Delta\text{H}} 2\text{NaHCO}_3(\text{s})$ <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <math>\swarrow</math>              1(b)(iii)              -35.1 or y         </div> <div style="text-align: center;"> <math>\searrow</math>              2 x 1(b)(ii)              2(+26.4) or 2x         </div> </div> $2\text{NaCl}(\text{aq}) + \text{H}_2\text{O}(\text{l}) + \text{CO}_2(\text{g})$ <p> <math>\Delta H = 1(\text{b})(\text{iii}) - [2 \times 1(\text{b})(\text{ii})]</math>  <math>= -35.1 - 2(26.4)</math>  <math>= -87.9 \text{ kJ mol}^{-1} \text{ or } -87900 \text{ J mol}^{-1} \text{ or } y - 2x</math> </p> <p style="text-align: right;"><math>\Delta H = \dots\dots\dots [3]</math></p>
(c)	<p>A student repeated <b>1(b)(iii)</b> using ethanoic acid in place of hydrochloric acid.</p> <p>Explain how the temperature rise when using ethanoic acid would compare to the temperature rise recorded in <b>1(b)(iii)</b>. Assume all volumes and concentrations of solutions are the same.</p>	
	<p>.....</p> <p>.....</p> <p>.....[2]</p>	
	<p>Temperature rise will be lower.</p> <p>Ethanoic acid is a weak acid and partially dissociates in water. Some of the energy will be absorbed to complete the dissociation of <math>\text{CH}_3\text{COOH}</math>.</p>	

[Total:13]

## 2 Investigation of the kinetics of an acid-catalysed reaction between propanone and iodine

**FA 2** is  $2.00 \text{ mol dm}^{-3}$  hydrochloric acid,  $\text{HCl}$

**FA 3** is  $0.0100 \text{ mol dm}^{-3}$  sodium thiosulfate,  $\text{Na}_2\text{S}_2\text{O}_3$

**FA 4** is aqueous iodine,  $\text{I}_2$

**FA 5** is  $1.50 \text{ mol dm}^{-3}$  propanone,  $\text{CH}_3\text{COCH}_3$

**FA 6** is  $0.50 \text{ mol dm}^{-3}$  sodium hydrogen carbonate,  $\text{NaHCO}_3$

You are also provided with a starch indicator.

The iodination of propanone to form iodopropanone proceeds as shown in the equation below.  
This reaction is catalysed by hydrogen ions.

This reaction is first order with respect to both  $\text{CH}_3\text{COCH}_3$  and  $\text{H}^+$  ions.

You are to investigate the order of reaction with respect to  $\text{I}_2$ .

A reaction mixture containing **FA 2**, **FA 4** and **FA 5** is first prepared. At different chosen times, aliquots (portions) of this reaction mixture are removed and added to excess **FA 6**.

It is necessary that you titrate each aliquot against **FA 3** before transferring the next aliquot.  $\text{I}_2$  and  $\text{S}_2\text{O}_3^{2-}$  react as shown in equation 5.

The required order of reaction can be obtained by graphical analysis of your results.

(a)	(i)	<b>Preparation and titration of the reaction mixture</b>
		<p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>• Please cap <b>FA 4</b> and <b>FA 5</b> after use.</li> <li>• You will perform each titration <b>once</b> only. Great care must be taken that you do not overshoot the end-point.</li> <li>• Once you have started the stopwatch, it must continue running for the duration of the experiment. You must <b>not</b> stop it until you have finished this experiment.</li> <li>• You should aim to transfer your first aliquot within the first three minutes of starting the reaction.</li> <li>• You should aim <b>not</b> to exceed a maximum reaction time of 25 minutes for this experiment.</li> </ul> <p>In an appropriate format in the space provided, prepare a table in which to record for each aliquot</p> <ul style="list-style-type: none"> <li>• the time of transfer, <math>t</math>, in minutes and seconds,</li> <li>• the decimal time, <math>t_d</math>, in minutes, to 0.1min, for example, if <math>t = 3\text{min } 11\text{s}</math> then <math>t_d = 3\text{ min} + 11/60\text{ min} = 3.2\text{ min}</math>,</li> <li>• the burette readings and the volume of <b>FA 3</b> added.</li> </ul> <ol style="list-style-type: none"> <li>1. Fill a burette with <b>FA 3</b>.</li> <li>2. Using measuring cylinders, add <math>50.0\text{ cm}^3</math> of <b>FA 4</b> and <math>25.0\text{ cm}^3</math> of <b>FA 2</b> to the conical flask labelled <b>reaction mixture</b>.</li> <li>3. Using a measuring cylinder, add <math>25.0\text{ cm}^3</math> of <b>FA 5</b> to the same conical flask. Start the stopwatch. Swirl the mixture thoroughly to mix its contents.</li> <li>4. Using a measuring cylinder, add <math>20.0\text{ cm}^3</math> of <b>FA 6</b> to a second conical flask.</li> <li>5. Transfer a <math>10.0\text{ cm}^3</math> aliquot (portion) of the reaction mixture to a <math>10\text{ cm}^3</math> measuring cylinder, using a dropping pipette.</li> </ol>

	<div>6. <b>Immediately</b> transfer this aliquot into the conical flask containing <b>FA 6</b> and vigorously swirl the mixture. Read and record the time of transfer in minutes and seconds, to the nearest second, when the aliquot is added.</div> <div>7. Immediately titrate the <math>I_2</math> in the conical flask with <b>FA 3</b> until the solution is pale yellow. [3]

(b)	(i)	State the relationship between the concentration of iodine remaining in the reaction mixture and the volume of <b>FA 3</b> used in the titration.
		<p><math>[I_2]</math> is directly proportional to the volume of FA 3 used</p> <p>.....</p> <p>.....[1]</p>
	(ii)	<p>Deduce the order of reaction with respect to <math>I_2</math>. Use evidence from your graph in Fig. 2.1 to support your answer.</p> <p>Zero order. Graph is a straight line / has constant gradient / <math>[I_2]</math> decreases linearly with time / <math>[I_2]</math> decreases at a constant rate.</p> <p>.....</p> <p>.....[1]</p>
(c)		The initial rate of change of the concentration of iodine, <b>FA 4</b> , $[I_2]$ , can be determined from the gradient of the graph in Fig. 2.1 at time $t_d = 0.0$ min.
	(i)	Determine the gradient of the graph at time $t_d = 0.0$ min, showing clearly the coordinates on the graph how you did this.

		$\text{Gradient} = \frac{19.7-8.9}{0-20}$ $= -0.540 \text{ cm}^3 \text{ min}^{-1}$ $\text{gradient} = \dots\dots\dots \text{ cm}^3 \text{ min}^{-1} [2]$
	(ii)	<p>Use your gradient to determine the rate of change of the amount of <math>\text{S}_2\text{O}_3^{2-}</math> ions required in <math>\text{mol min}^{-1}</math>.</p> $\text{rate of change of the amount of } \text{S}_2\text{O}_3^{2-} \text{ ions required} = \frac{0.540}{1000} \times 0.01$ $= 5.40 \times 10^{-6} \text{ mol min}^{-1}$ $\text{rate of change of the amount of } \text{S}_2\text{O}_3^{2-} \text{ ions required} = \dots\dots\dots \text{ mol min}^{-1} [1]$
	(iii)	<p>Sodium thiosulfate and iodine react as shown in equation 5.</p> <p><b>equation 5</b>      <math>2\text{S}_2\text{O}_3^{2-}(\text{aq}) + \text{I}_2(\text{aq}) \longrightarrow 2\text{I}^{-}(\text{aq}) + \text{S}_4\text{O}_6^{2-}(\text{aq})</math></p> <p>Determine the change in amount of <math>\text{I}_2</math> per minute and hence deduce the rate of change of <math>[\text{I}_2]</math> at <math>t_d = 0.0 \text{ min}</math>, in <math>\text{mol dm}^{-3} \text{ min}^{-1}</math>.</p> $\text{change in amount of } \text{I}_2 \text{ per minute} = 5.40 \times 10^{-6} \div 2$ $= 2.70 \times 10^{-6} \text{ mol min}^{-1}$ $\text{change in amount of } \text{I}_2 \text{ per minute} = \dots\dots\dots \text{ mol min}^{-1}$ $\text{rate of change of } [\text{I}_2] \text{ at } t_d = 0.0 \text{ min} = 2.70 \times 10^{-6} \div \frac{10}{1000}$ $= 2.70 \times 10^{-4} \text{ mol dm}^{-3} \text{ min}^{-1}$ $\text{rate of change of } [\text{I}_2] \text{ at } t_d = 0.0 \text{ min} = \dots\dots\dots \text{ mol dm}^{-3} \text{ min}^{-1} [4]$
(d)		<p>Step 6 requires you to add each aliquot immediately to an excess of sodium hydrogen carbonate solution, <b>FA 6</b>. Suggest an explanation for this requirement.</p> <p><math>\text{NaHCO}_3</math> quenches the reaction by reacting with the acid catalyst.</p> <p>.....</p> <p>.....[1]</p>

(e)	Explain why the concentration of iodine in <b>FA 4</b> used is very much lower than the concentrations of propanone in <b>FA 5</b> and of hydrochloric acid in <b>FA 2</b> .
	<p>With propanone and hydrochloric acid in large excess, the concentration of propanone and acid will be approximately constant. Order of reaction with respect to iodine can then be determined because any change in rate will be due to the change in concentration of iodine.</p> <p>.....</p> <p>.....</p> <p>.....</p> <p>.....[1]</p>

[Total: 18]

**3 Investigation of an organic compound and an inorganic compound**

**FA 6** is  $0.50 \text{ mol dm}^{-3}$  sodium hydrogen carbonate,  $\text{NaHCO}_3$  from question 2.

**FA 7** is an organic solid, **Y**, which contains two different functional groups.

**FA 9** contains two cations and one anion.

You will perform tests to identify:

- the functional groups in **Y** and hence deduce its possible structure.
- the ions present in **FA 9**.

(a) (i) Place one spatula of solid **FA 7** in a boiling tube. Add to the solid about  $5 \text{ cm}^3$  of ethanol followed by  $5 \text{ cm}^3$  of distilled water. Shake to ensure complete mixing. Label this solution **FA 8**.

Using a fresh sample for each of the following tests. Carefully record your observations in Table 3.1. The volumes given below are approximate and should be estimated rather than measured.

Test and identify any gases evolved.

If there is no observable change, write **no observable change**.

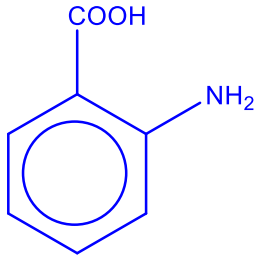

**Table 3.1**

	Test	Observations
1	Using a test-tube holder for the test-tube, place about 5 drops of aqueous silver nitrate in a test-tube; add aqueous sodium hydroxide dropwise until brown ppt appears. Then add aqueous ammonia drop-wise until the ppt just dissolves.  Add about 10 drops of the <b>FA 8</b> solution, shake and warm for 5 minutes in the water bath.  Continue with the remaining parts of Question 3.	no observable change
2	To a 2 cm depth of <b>FA 8</b> in a test-tube, add $1 \text{ cm}^3$ of <b>FA 6</b> .	Effervescence seen  Gas forms white ppt with limewater
3	Place about 1 cm depth of <b>FA 8</b> into a test tube. Using a test-tube holder, add 8 drops of aqueous bromine at the fumehood.	The orange $\text{Br}_2$ is decolourised with formation of white ppt .
	<b>Please dispose all organic waste into the bottle labelled "Organic Waste" and cap the bottle.</b>	
		[3]

(ii) Identity the functional group that Test 1 is used to determine in **Table 3.1**.

Aldehyde

[1]

		(iii)	Suggest <b>two</b> functional groups that could be present in <b>FA 7</b> .  ..... and ..... [1] Carboxyl (Carboxylic acid) AND phenol or phenylamine
		(iv)	The molecular formula of <b>Y</b> is $C_7H_7O_2N$ . Draw one possible structure for <b>Y</b> . Use your observations in Table 3.1. [1]  

(b)	(i)	Use a fresh sample for each of the following tests. Carefully record your observations in Table 3.2.												
		<p style="text-align: center;"><b>Table 3.2</b></p> <table> <tr> <th></th><th>Test</th><th>Observations</th></tr> <tr> <td>1</td><td>To a 1 cm depth of <b>FA 9</b> in a test-tube, add aqueous ammonia slowly, with shaking, until no further change is seen.</td><td>Red-brown ppt insoluble in excess</td></tr> <tr> <td>2</td><td>To a 1 cm depth of <b>FA 9</b> in a test-tube, add aqueous sodium hydroxide slowly, with shaking, until no further change is seen.  Warm the mixture using the water bath.</td><td>Red-brown ppt insoluble in excess.  On warming, gas turns moist red litmus paper blue.</td></tr> <tr> <td>3</td><td>To a 1 cm depth of <b>FA 9</b> in a test-tube, add 4–5 drops of aqueous silver nitrate</td><td>White ppt formed</td></tr> </table> <p style="text-align: right;">[3]</p>		Test	Observations	1	To a 1 cm depth of <b>FA 9</b> in a test-tube, add aqueous ammonia slowly, with shaking, until no further change is seen.	Red-brown ppt insoluble in excess	2	To a 1 cm depth of <b>FA 9</b> in a test-tube, add aqueous sodium hydroxide slowly, with shaking, until no further change is seen.  Warm the mixture using the water bath.	Red-brown ppt insoluble in excess. 	Test	Observations												
1	To a 1 cm depth of <b>FA 9</b> in a test-tube, add aqueous ammonia slowly, with shaking, until no further change is seen.	Red-brown ppt insoluble in excess												
2	To a 1 cm depth of <b>FA 9</b> in a test-tube, add aqueous sodium hydroxide slowly, with shaking, until no further change is seen.  Warm the mixture using the water bath.	Red-brown ppt insoluble in excess.  On warming, gas turns moist red litmus paper blue.												
3	To a 1 cm depth of <b>FA 9</b> in a test-tube, add 4–5 drops of aqueous silver nitrate	White ppt formed												
	(ii)	Identify the anion present in <b>FA 9</b> . Use evidence from your observations in <b>Table 3.2</b> to support your deduction.												
		<p style="text-align: center;"><math>Cl^-</math></p> <p>Anion: .....</p>												

		<p>Evidence:</p> <p>.....</p> <p>.....</p> <p>[1]</p> <p>Formation of white ppt in test 3 or on addition of <math>\text{AgNO}_3(\text{aq})</math> shows the presence of <math>\text{Cl}^-</math>.</p>
	(iii)	Describe one further test you can carry out to confirm the identity of the anion present in <b>FA 9</b> .
		Add excess ammonia to the precipitate formed in tests 3 to see if it is soluble. If it is soluble in excess ammonia, the anion is $\text{Cl}^-$ .
		<p>.....</p> <p>.....</p> <p>..... [1]</p>
	(iv)	Identify the cations present in <b>FA 9</b> .
		<p><math>\text{Fe}^{3+}</math> <math>\text{NH}_4^+</math></p> <p>Cation: .....and ..... [1]</p>

4	<b>Planning</b>
	<p>We usually think of iron occurring in compounds in the +2 or +3 oxidation states. However, other oxidation states of iron are possible; for example, potassium ferrate(VI), <math>\text{K}_2\text{FeO}_4</math>, contains iron in the +6 oxidation state.</p> <p>Solutions containing the <math>\text{FeO}_4^{2-}</math> ion are dark red in colour. The <math>\text{FeO}_4^{2-}</math> ion is a stronger oxidising agent than the <math>\text{MnO}_4^-</math> ion. In acidic conditions, <math>\text{FeO}_4^{2-}</math> ions are reduced to <math>\text{Fe}^{3+}</math> ions.</p> <p>A student was given a solution, <b>FB 1</b>, containing potassium ferrate(VI). She was told that by titrating a standard solution of sodium chloride, <math>\text{NaCl}</math>, against <b>FB 1</b>, the concentration of <math>\text{FeO}_4^{2-}</math> ions in <b>FB 1</b> can be found. At the end point, the reaction mixture turns from colourless to orange.</p> <p>Chloride ions are oxidised as shown:</p> $2\text{Cl}^-(\text{aq}) \rightarrow \text{Cl}_2(\text{g}) + 2\text{e}^-$ <p>The overall equation in the reaction between <math>\text{FeO}_4^{2-}</math> and <math>\text{Cl}^-</math> is as shown:</p> $6\text{Cl}^-(\text{aq}) + 16\text{H}^+(\text{aq}) + 2\text{FeO}_4^{2-}(\text{aq}) \rightarrow 3\text{Cl}_2(\text{g}) + 2\text{Fe}^{3+}(\text{aq}) + 8\text{H}_2\text{O}(\text{l})$ <p>She tested the <math>0.100 \text{ mol dm}^{-3}</math> solution of <math>\text{NaCl}</math> provided. She found that 10 drops of <b>FB 1</b>, when suitably acidified, reacted completely with 32 drops of <math>\text{NaCl}</math> solution.</p>
(a)	<p>Explain why the <math>0.100 \text{ mol dm}^{-3}</math> solution of <math>\text{NaCl}</math> first provided would have been unsuitable for use in the student's titration. [1]</p> <p>10 drops of FB 1 reacted completely with 32 drops of <math>\text{NaCl}</math> solution implies that in a titration, only <math>7.80 \text{ cm}^3</math> of FB 1 is needed to react with <math>25.0 \text{ cm}^3</math> of <math>0.100 \text{ mol dm}^{-3}</math> <math>\text{NaCl}</math> (or titre volume will be too low), leading to high percentage error.</p>
(b)	<p>She correctly deduced that a suitable concentration of the solution of <math>\text{NaCl}</math> for titration against the <b>FB 1</b> solution was <math>0.320 \text{ mol dm}^{-3}</math>. This solution of <math>\text{NaCl}</math> is labelled as <b>FB 2</b>.</p>
(i)	<p>Using this data, calculate the mass of solid sodium chloride, <math>\text{NaCl}</math>, required to make a <math>250 \text{ cm}^3</math> standard solution of <b>FB 2</b> for the experiment. [1]</p> <p><math>[A_r: \text{Na}, 23.0; \text{Cl}, 35.5]</math></p> <p>Amount of <math>\text{NaCl}</math> needed = <math>0.320 \times \frac{250}{1000} = 0.0800 \text{ mol}</math></p> <p>Mass of <math>\text{NaCl}</math> solid = <math>0.08 \times (23.0 + 35.5) = 4.68 \text{ g}</math></p>
(ii)	<p>Write a plan for the volumetric analysis of <b>FB 1</b>. Your plan should include the preparation of a <math>250 \text{ cm}^3</math> standard solution of <b>FB 2</b>.</p> <p>You may assume that you are provided with:</p> <ul style="list-style-type: none"> <li>aqueous potassium ferrate(VI), <b>FB 1</b></li> </ul>

	<ul style="list-style-type: none"> <li>6 g solid sodium chloride</li> <li>1 mol dm<sup>-3</sup> sulfuric acid</li> <li>distilled water</li> <li>the equipment normally found in a school or college laboratory</li> </ul> <p>Include in your plan:</p> <ul style="list-style-type: none"> <li>the apparatus you would use,</li> <li>the quantities you would use,</li> <li>the procedure you would follow,</li> <li>the measurements you would make.</li> </ul> <p>Note: No heating is needed for this titration although activation energy is high for similarly charged _____ ions _____ to _____ react. [7]</p>
	<ol style="list-style-type: none"> <li>Using a weighing balance, weigh 4.68 g of solid NaCl in a 100cm<sup>3</sup> beaker.</li> <li>Using a 50cm<sup>3</sup> measuring cylinder, add 50cm<sup>3</sup> of sulfuric acid into the beaker to dissolve the solid.</li> <li>Transfer the solution into a 250cm<sup>3</sup> volumetric flask.</li> <li>Rinse the 100cm<sup>3</sup> beaker with distilled water several times and adding each rinsing into the 250cm<sup>3</sup> volumetric flask.</li> <li>Make up to the mark with distilled water.</li> <li>Stopper, invert and shake. Label this solution as FB 2.</li> <li>Pipette 25.0 cm<sup>3</sup> of FB 2 into a 250 cm<sup>3</sup> conical flask.</li> <li>Fill a burette with FB 1.</li> <li>Titrate FB 2 against FB 1 until the solution turns from colourless to orange.</li> <li>Repeat the titration to obtain two consistent readings of <math>\pm 0.10\text{cm}^3</math>.</li> </ol>
(c)	<p>In the student's titration, she found that <math>p\text{ cm}^3</math> of <b>FB 1</b> reacted with exactly <math>q\text{ cm}^3</math> of <b>FB 2</b> of concentration <math>M\text{ mol dm}^{-3}</math>.</p> <p>Outline how you would use her results to determine the concentration of <b>FB 1</b>. [2]</p>
	<p>No. of moles of <b>FB2</b> used in titration = <math>\frac{M}{1000} \times q</math></p> <p>No. of moles of <b>FB1</b> used in titration = <math>\frac{M}{1000} \times q \times \frac{1}{3}</math></p> <p>Concentration of <b>FB1</b> = <math>\frac{M}{1000} \times q \times \frac{1}{3} \div \frac{p}{1000}</math></p> <p style="text-align: center;">= <math>\frac{Mq}{3p}\text{ mol dm}^{-3}</math></p>
(d)	<p>Explain the effect of using hydrochloric acid in place of sulfuric acid on the titre value. [1]</p> <p>Titre value will be larger because more FB1 will be required to react with the additional chloride</p>

	ions introduced by the presence of HCl.

## Qualitative Analysis Notes

[ppt. = precipitate]

### (a) Reactions of aqueous cations

<b>cation</b>	<b>reaction with</b>	
	NaOH(aq)	NH <sub>3</sub> (aq)
aluminium, Al <sup>3+</sup> (aq)	white ppt. soluble in excess	white ppt. insoluble in excess
ammonium, NH <sub>4</sub> <sup>+</sup> (aq)	ammonia produced on heating	–
barium, Ba <sup>2+</sup> (aq)	no ppt. (if reagents are pure)	no ppt.
calcium, Ca <sup>2+</sup> (aq)	white ppt. with high [Ca <sup>2+</sup> (aq)]	no ppt.
chromium(III), Cr <sup>3+</sup> (aq)	grey-green ppt. soluble in excess giving dark green solution	grey-green ppt. insoluble in excess
copper(II), Cu <sup>2+</sup> (aq)	pale blue ppt. insoluble in excess	blue ppt. soluble in excess giving dark blue solution
iron(II), Fe <sup>2+</sup> (aq)	green ppt., turning brown on contact with air insoluble in excess	green ppt., turning brown on contact with air insoluble in excess
iron(III), Fe <sup>3+</sup> (aq)	red-brown ppt. insoluble in excess	red-brown ppt. insoluble in excess
magnesium, Mg <sup>2+</sup> (aq)	white ppt. insoluble in excess	white ppt. insoluble in excess
manganese(II), Mn <sup>2+</sup> (aq)	off-white ppt., rapidly turning brown on contact with air insoluble in excess	off-white ppt., rapidly turning brown on contact with air insoluble in excess
zinc, Zn <sup>2+</sup> (aq)	white ppt. soluble in excess	white ppt. soluble in excess

**(b) Reactions of anions**

<i>ions</i>	<i>reaction</i>
carbonate, $\text{CO}_3^{2-}$	$\text{CO}_2$ liberated by dilute acids
chloride, $\text{Cl}^-(\text{aq})$	gives white ppt. with $\text{Ag}^+(\text{aq})$ (soluble in $\text{NH}_3(\text{aq})$ )
bromide, $\text{Br}^-(\text{aq})$	gives pale cream ppt. with $\text{Ag}^+(\text{aq})$ (partially soluble in $\text{NH}_3(\text{aq})$ )
iodide, $\text{I}^-(\text{aq})$	gives yellow ppt. with $\text{Ag}^+(\text{aq})$ (insoluble in $\text{NH}_3(\text{aq})$ )
nitrate, $\text{NO}_3^-(\text{aq})$	$\text{NH}_3$ liberated on heating with $\text{OH}^-(\text{aq})$ and Al foil
nitrite, $\text{NO}_2^-(\text{aq})$	$\text{NH}_3$ liberated on heating with $\text{OH}^-(\text{aq})$ and Al foil; $\text{NO}$ liberated by dilute acids (colourless $\text{NO} \rightarrow$ (pale) brown $\text{NO}_2$ in air)
sulfate, $\text{SO}_4^{2-}(\text{aq})$	gives white ppt. with $\text{Ba}^{2+}(\text{aq})$ (insoluble in excess dilute strong acids)
sulfite, $\text{SO}_3^{2-}(\text{aq})$	$\text{SO}_2$ liberated with dilute acids; gives white ppt. with $\text{Ba}^{2+}(\text{aq})$ (soluble in dilute strong acids)

**(c) Test for gases**

<i>gas</i>	<i>test and test result</i>
ammonia, $\text{NH}_3$	turns damp red litmus paper blue
carbon dioxide, $\text{CO}_2$	gives a white ppt. with limewater (ppt. dissolves with excess $\text{CO}_2$ )
chlorine, $\text{Cl}_2$	bleaches damp litmus paper
hydrogen, $\text{H}_2$	"pops" with a lighted splint
oxygen, $\text{O}_2$	relights a glowing splint
sulfur dioxide, $\text{SO}_2$	turns aqueous acidified potassium manganate(VII) from purple to colourless

**(d) Colour of halogens**

<i>halogen</i>	<i>colour of element</i>	<i>colour in aqueous solution</i>	<i>colour in hexane</i>
chlorine, $\text{Cl}_2$	greenish yellow gas	pale yellow	pale yellow
bromine, $\text{Br}_2$	reddish brown gas / liquid	orange	orange-red
iodine, $\text{I}_2$	black solid / purple gas	brown	purple
