ANGLO-CHINESE JUNIOR COLLEGE  
DEPARTMENT OF CHEMISTRY  
Preliminary Examination

**CHEMISTRY**  
**Higher 2**

**9729/02**

**Paper 2 Structured Questions**

**26 August 2019**  
**2 hours**

Candidates answer on the Question Paper.

Additional Materials: Data Booklet

**READ THESE INSTRUCTIONS FIRST**

Write your name, index number, form class, tutorial class and subject tutor's name on all the work you hand in.

Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, glue or correction fluid.

Answer **all** questions in the spaces provided on the Question Paper.

The use of an approved scientific calculator is expected, where appropriate.

A Data Booklet is provided.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

For Examiner's Use	
Question no.	Marks
1	/ 7
2	/ 21
3	/ 15
4	/ 7
5	/ 11
6	/ 14
<b>TOTAL</b>	<b>/ 75</b>

This document consists of **21** printed pages and **1** blank page.

1	(a)	The element aluminium and its compounds have some properties characteristic of metals, and some of non-metals. Aluminium hydroxide, for example, is known to be <i>amphoteric</i> .	
		(i)	Explain the meaning of the word “amphoteric”. [1]
			The ability to react with both acids and bases.
		Aluminium sulfate and calcium oxide are sometimes added to water supplies to co-precipitate suspended solids and bacteria. A small amount of aluminium-containing ions remains in solution and its presence in drinking water may contribute to the mental illness known as Alzheimer’s disease.	
		(ii)	Write a balanced equation for the reaction that occurs when aluminium sulfate and calcium oxide are added to water, given that aluminium hydroxide is one of the products formed. [1]
			$\text{Al}_2(\text{SO}_4)_3 + 3\text{CaO} + 3\text{H}_2\text{O} \rightarrow 2\text{Al}(\text{OH})_3 + 3\text{CaSO}_4$
		(iii)	By considering the nature of calcium oxide, explain why adding too much of it would increase the risk of contracting Alzheimer’s disease.  Write an equation to illustrate how “aluminium-containing ions remains in (drinking water)” as a result of adding too much calcium oxide. [2]
			CaO dissolves slightly to form an alkaline solution. OH <sup>-</sup> thus formed reacts with Al(OH) <sub>3</sub> to form a soluble complex.  $\text{Al}(\text{OH})_3 + \text{OH}^- \rightarrow \text{Al}(\text{OH})_4^-$
1	(b)	Beryllium oxide (BeO) is amphoteric, just like Al(OH) <sub>3</sub> .	
		(i)	Beryllium oxide reacts with sodium hydroxide according to the equation,  $2\text{NaOH} + \text{BeO} \longrightarrow \text{Na}_2\text{BeO}_2 + \text{H}_2\text{O}$  Given the position of beryllium in the Periodic Table, explain how this reaction illustrates the amphoteric nature of beryllium oxide. [2]  BeO: Gp 2 ( <b>metallic</b> ) oxide, expected to form <u>basic oxide</u> and to react with <u>acid</u> .  but here it is reacting with an alkali, illustrating its acidic nature.

		<p><b>(ii)</b> To further illustrate its amphoteric nature, at 500 °C, BeO reacts with Na<sub>2</sub>O to form compound <b>F</b> as the <b>sole product</b>. The molar masses of all three compounds are tabulated below.</p> <table><tr><td>compound</td><td>molar mass / g mol<sup>-1</sup></td></tr><tr><td>BeO</td><td>25</td></tr><tr><td>Na<sub>2</sub>O</td><td>62</td></tr><tr><td><b>F</b></td><td>149</td></tr></table> <p>Write a balanced equation of the above reaction.</p> <p style="text-align: center;"><b>BeO + 2Na<sub>2</sub>O → Na<sub>4</sub>BeO<sub>3</sub></b></p>	compound	molar mass / g mol <sup>-1</sup>	BeO	25	Na <sub>2</sub> O	62	<b>F</b>	149			
compound	molar mass / g mol <sup>-1</sup>												
BeO	25												
Na <sub>2</sub> O	62												
<b>F</b>	149												
		[Total: 7]											
2	<p><b>(a)</b> In the laboratory, there are three bottles labelled <b>X</b>, <b>Y</b> and <b>Z</b>. Each bottle contains one of the following reagents:</p> <p style="text-align: center;">KI(aq), Cl<sub>2</sub>(aq), and NaBr(aq)</p> <p>Three tests were carried out using the reagents in the bottles. The results are summarised in the table below:</p> <table><tr><td>test</td><td>procedure</td><td>observations</td></tr><tr><td>1</td><td>mix reagent in bottle <b>X</b> with reagent in bottle <b>Z</b></td><td>no change in colour</td></tr><tr><td>2</td><td>mix reagent in bottle <b>Y</b> with reagent in bottle <b>Z</b></td><td>mixture turns brown</td></tr><tr><td>3</td><td>mix reagent in bottle <b>Y</b> with reagent in bottle <b>X</b></td><td>mixture turns reddish-brown</td></tr></table>	test	procedure	observations	1	mix reagent in bottle <b>X</b> with reagent in bottle <b>Z</b>	no change in colour	2	mix reagent in bottle <b>Y</b> with reagent in bottle <b>Z</b>	mixture turns brown	3	mix reagent in bottle <b>Y</b> with reagent in bottle <b>X</b>	mixture turns reddish-brown
test	procedure	observations											
1	mix reagent in bottle <b>X</b> with reagent in bottle <b>Z</b>	no change in colour											
2	mix reagent in bottle <b>Y</b> with reagent in bottle <b>Z</b>	mixture turns brown											
3	mix reagent in bottle <b>Y</b> with reagent in bottle <b>X</b>	mixture turns reddish-brown											
	<p><b>(i)</b> By comparing relevant standard reduction potential values from the Data Booklet, explain how it can be deduced that <b>Y</b> is aqueous chlorine. There is <b>no</b> need for calculations.</p>	[1]											
		<p>Chlorine has the most positive standard reduction potential (compared to that of bromine and iodine) hence it is able to oxidise both iodide and bromide.</p>											

		(ii)	<p>Tests 2 and 3 were executed to determine the reagents in bottles <b>X</b> and <b>Z</b>.</p> <p>Hexane was added to the resulting reaction mixture after the tests were conducted. The bottles were then shaken and allowed to stand.</p> <p>State the observations that will indicate whether the bottles contained KI(aq) or NaBr(aq) initially. [2]</p> <p>The bottle with orange-red organic layer contains NaBr (aq) initially. The bottle with violet / purple organic layer contains KI (aq) initially.</p>
2	(b)		<p>Sulfur dichloride, <math>\text{SCl}_2</math>, is a cherry-red liquid at room temperature and pressure.</p> <p><math>\text{SCl}_2</math> is formed from <math>\text{S}_8</math> and <math>\text{Cl}_2</math>.</p>
		(i)	<p>Explain why <math>\text{S}_8</math> exists as a solid while <math>\text{Cl}_2</math> exists as a gas at room temperature. [2]</p> <p>Both exist as non-polar simple covalent molecules.</p> <p>The size of the electron cloud of sulfur is so much larger hence the intermolecular interactions amongst sulfur molecules are stronger than the intermolecular interactions amongst chlorine molecules.</p> <p>Therefore the melting point of sulfur is significantly higher than that of chlorine.</p>
		(ii)	<p>The formation of <math>\text{SCl}_2</math> from <math>\text{S}_8</math> and <math>\text{Cl}_2</math> takes place in two steps.</p> <p>The first step involves disulfur dichloride, <math>\text{S}_2\text{Cl}_2</math>, as an intermediate.</p> $\text{S}_8 + 4\text{Cl}_2 \rightarrow 4\text{S}_2\text{Cl}_2$ <p>Write the equation of the second step. [1]</p> $\text{S}_2\text{Cl}_2 + \text{Cl}_2 \rightarrow 2\text{SCl}_2$
			<p>Some chemists speculate that the intermediate is not disulfur dichloride but <b>K</b>. <b>K</b> shares the same elemental mass percentages as sulfur dichloride and has a molar mass of <math>206.2 \text{ g mol}^{-1}</math>.</p>
		(iii)	<p>State the molecular formula of <b>K</b>. [1]</p> <p><math>\text{S}_2\text{Cl}_4</math></p>
		(iv)	<p>All the chlorine atoms in <b>K</b> are terminal.</p> <p>There are only two central atoms in <b>K</b>.</p> <p>The bond angles about each central atom are different.</p> <p>State the shape around each central atom and the respective bond angles. [2]</p> <p>See-saw (<math>90^\circ</math> and/or <math>120^\circ</math>). (<math>88^\circ</math> and/or <math>118^\circ</math>)</p> <p>and</p> <p>bent (<math>105^\circ</math> or <math>104.5^\circ</math>)</p>

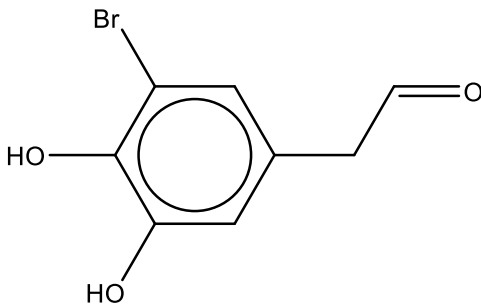

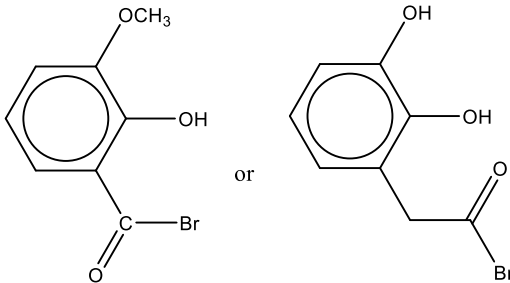

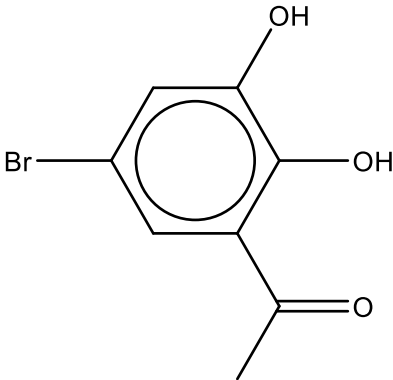

2	(c)	<p>Sulfuryl chloride, <math>\text{SO}_2\text{Cl}_2</math>, is commonly confused with thionyl chloride, <math>\text{SOCl}_2</math>.</p> <p>The properties of these two sulfur oxychlorides are quite different. <math>\text{SO}_2\text{Cl}_2</math> is a source of chlorine while <math>\text{SOCl}_2</math> is a source of chloride ions for various organic reactions.</p> <p>When heated, sulfuryl chloride decomposes endothermically as follows:</p> $\text{SO}_2\text{Cl}_2(\text{g}) \rightleftharpoons \text{SO}_2(\text{g}) + \text{Cl}_2(\text{g})$ <p>In an experiment, 1.00 mol of <math>\text{SO}_2\text{Cl}_2</math> vapour was heated in a closed 4.00 dm<sup>3</sup> flask at 500 K until equilibrium was established. The flask was then rapidly cooled to liquefy <math>\text{SO}_2\text{Cl}_2</math>.</p> <p>After removing gaseous <math>\text{SO}_2</math> and <math>\text{Cl}_2</math>, excess water was then carefully added to the liquid <math>\text{SO}_2\text{Cl}_2</math>, causing the following reaction to occur.</p> $\text{SO}_2\text{Cl}_2(\text{l}) + 2\text{H}_2\text{O}(\text{l}) \rightarrow \text{H}_2\text{SO}_4(\text{aq}) + 2\text{HCl}(\text{aq})$ <p>The resulting solution was made up to 250 cm<sup>3</sup> in a standard graduated flask.</p> <p>20.0 cm<sup>3</sup> of this solution was titrated with 1.00 mol dm<sup>-3</sup> NaOH. 40.00 cm<sup>3</sup> of NaOH was required for complete neutralisation.</p>
		<p>(i) Write an expression for <math>K_c</math> for the equilibrium above and state its units. [2]</p> $K_c = \frac{[\text{SO}_2][\text{Cl}_2]}{[\text{SO}_2\text{Cl}_2]}$ <p style="text-align: center;">mol dm<sup>-3</sup></p>
		<p>(ii) Calculate the equilibrium amount of <math>\text{SO}_2\text{Cl}_2</math>, <math>\text{SO}_2</math>, and <math>\text{Cl}_2</math> in the original equilibrium at 500 K. Hence calculate a value for the <math>K_c</math> for the equilibrium. [4]</p> <p><math>n(\text{H}_2\text{SO}_4) = \frac{1}{4} (40.00/1000)(250/20.0) = 0.125</math>  <math>n(\text{SO}_2\text{Cl}_2) \text{ at eqm} = 0.125</math>  <math>n(\text{SO}_2) \text{ and } n(\text{Cl}_2) \text{ at eqm are } 1.00 - 0.125 = 0.875 \text{ each}</math>  <math>K_c = (0.875)^2 / (0.125 \times 4) = 1.53 \text{ mol dm}^{-3}</math></p>
2	(c)	<p>(iii) A student suggested to carry out the decomposition process at a higher temperature and high pressure to decrease the time required for the process. Discuss the effects of the proposed changes on the rate and the yield. [2]</p> <p><u>At a higher temperature, both rate and yield would increase.</u></p> <p><u>However, at high pressures, the rate (but not the yield) would increase as the position of equilibrium will be shifted to the LHS</u></p>

2	(d)	<p><math>\text{SO}_2\text{Cl}_2</math> is widely used as a reagent in chlorination of the hydrocarbons. Such reactions occur under free radical conditions using <math>\text{H}_2\text{O}_2</math> as an initiator.</p> <p>For example, methylbenzene undergoes free radical substitution with <math>\text{SO}_2\text{Cl}_2</math> to give benzyl chloride, <math>\text{C}_6\text{H}_5\text{CH}_2\text{Cl}</math>.</p> <p>The mechanism of this reaction involves three stages:</p> <ol style="list-style-type: none"> <li>Initiation</li> <li>Propagation</li> <li>Termination</li> </ol> <ul style="list-style-type: none"> <li>The <b>initiation</b> stage is unique as it involves two successive steps.</li> </ul>
	(i)	<p>In the first step, there is an initial homolytic breaking of the peroxide bond in hydrogen peroxide forming two hydroxyl radicals.</p> <p>Using curly arrows, show the mechanism for this step.</p> <p style="text-align: right;">[1]</p> <div style="text-align: center;"> <math display="block">\text{HO}-\text{OH} \longrightarrow 2\text{OH}</math> </div>
		<p>The second initiation step involves the reaction between the hydroxyl radical and <math>\text{SO}_2\text{Cl}_2</math> to give <math>\text{SO}_2</math>, <math>\text{HOCl}</math> and a chlorine radical. It has been drawn for you below.</p> <div style="text-align: center;"> <math display="block">\text{HO}\cdot + \text{SO}_2\text{Cl}_2 \longrightarrow \text{HOCl} + \text{SO}_2 + \text{Cl}\cdot</math> </div> <p>After these two initiation steps,</p> <ul style="list-style-type: none"> <li>The chlorine radical then reacts with methylbenzene in two <b>propagation</b> steps to form benzyl chloride and regenerating the hydroxyl radicals.</li> <li>The chain reaction <b>terminates</b> when two radicals combine to give stable compounds.</li> </ul>
	(ii)	<p>Complete the mechanism by writing the steps for the <b>propagation</b> and <b>termination</b> stages.</p> <p style="text-align: right;">[3]</p>
		<p><b>Propagation</b></p> <div style="text-align: center;"> <math display="block">\text{C}_6\text{H}_5\text{CH}_3 + \text{Cl}\cdot \longrightarrow \text{HCl} + \text{C}_6\text{H}_5\text{CH}_2\cdot</math> <math display="block">\text{C}_6\text{H}_5\text{CH}_2\cdot + \text{SO}_2\text{Cl}_2 \longrightarrow \text{C}_6\text{H}_5\text{CH}_2\text{Cl} + \cdot\text{OH}</math> </div>
		<p><b>Termination</b></p> <p><math>2\text{OH} \rightarrow \text{H}_2\text{O}_2</math></p> <p><math>\text{HO} + \text{Cl} \rightarrow \text{HOCl}</math></p>
		[Total: 21]

3	(b)	A buffer is obtained after the addition of 12.00 cm <sup>3</sup> of NaOH solution.	
		(v)	Write an equation for the reaction that occurs when a drop of HNO <sub>3</sub> is added to this buffer. [1]  $\text{HO}_2\text{CCH}_2\text{CO}_2^- + \text{H}^+ \rightarrow \text{HO}_2\text{CCH}_2\text{CO}_2\text{H}$
		(vi)	Calculate the pH of this buffer. [2]  $n(\text{malonic acid}) \text{ remaining} = [(15.0)(0.100) - (12.00)(0.100)] / 1000$ $= 3.00 \times 10^{-4}$ $n(\text{HO}_2\text{CCH}_2\text{CO}_2^-) = (12.00)(0.100) / 1000$ $= 1.20 \times 10^{-3}$ $\text{pH} = -\log (1.51 \times 10^{-3}) + \log (12.0/3.00) = 3 + \log (4/1.51) = 3.42$
		(vii)	Another buffer is obtained after the addition of 22.50 cm <sup>3</sup> of NaOH solution. Calculate its pH. [1]  $\text{pH} = \text{pK}_{a2} = -\log (2.00 \times 10^{-6}) = 6 - \lg 2.00 = 5.70$
			[Total: 15]
4	<p><b>V</b> is a mono-brominated derivative of <i>ortho</i>-vanillin. <i>Ortho</i>-vanillins are used in the study of mutagenesis and as a synthetic precursor for pharmaceuticals.</p> <div style="text-align: center;">  <p><b>V</b></p> </div>		
	(a)	<p>Define the term “constitutional isomerism”. [1]</p> <p>Compounds having the same molecular formula but different structural formulae/different structures.</p>	

	<p><b>(b)</b> <b>U</b> is a constitutional isomer of <b>V</b>.</p> <div style="text-align: center;">  <p><b>U</b></p> </div> <p>State a simple chemical test to distinguish between <b>U</b> and <b>V</b>. State the observations. [2]</p> <p>Fehling's test. No ppt for <b>V</b>. brick-red/brown/reddish-brown ppt for <b>U</b>.</p>
	<p><b>The structures you draw from 4(c) to 4(e) must contain one benzene ring.</b></p>
	<p><b>(c)</b> Draw the structural formula of a constitutional isomer of <b>V</b> which can be distinguished from <b>V</b> itself by cold <math>\text{AgNO}_3</math> solution. State the observations. [2]</p> <div style="text-align: center;">  </div> <p>No ppt for <b>X</b>. Cream/off-white ppt for this constitutional isomer.</p> <p><b>The structures you draw from 4(c) to 4(e) must contain one benzene ring.</b></p>
4	<p><b>(d)</b> Draw the structural formula of a constitutional isomer of <b>V</b> which can be distinguished from <b>V</b> itself by warm alkaline iodine. [1]</p> <div style="text-align: center;">  </div>

- (e) Draw the structural formula of a constitutional isomer of **V** which can be distinguished from **V** itself via 2,4-dinitrophenylhydrazine but not neutral iron(III) chloride solution not sodium metal. [1]

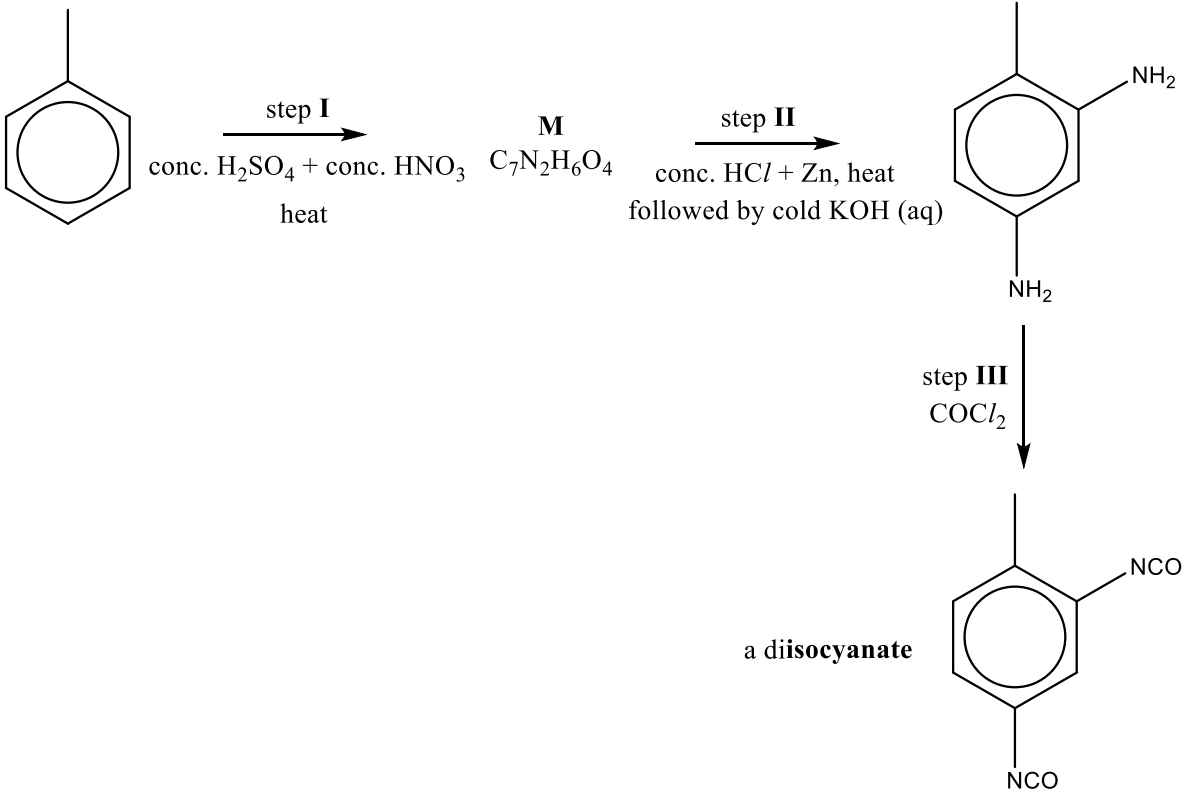

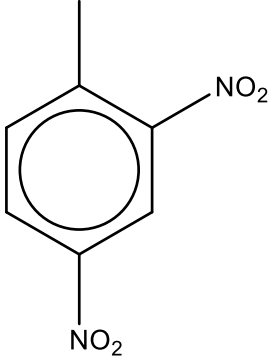

[Total: 7]

5	Space-suits need to be designed in such a way to supply oxygen to astronauts and to remove the carbon dioxide exhaled by them.		
	(a)	<p>Metal oxides like silver oxide, <math>\text{Ag}_2\text{O}</math>, are used to get rid of the carbon dioxide.</p> <p><math>\text{Ag}_2\text{O}</math> reacts reversibly with carbon dioxide, as described in the equilibrium equation,</p> $\text{Ag}_2\text{O (s)} + \text{CO}_2 \text{ (g)} \rightleftharpoons \text{Ag}_2\text{CO}_3 \text{ (s)}$ <p>The van't Hoff plot shows how the equilibrium constant, <math>K_p</math>, of this reaction varies with temperature.</p> 	
	(i)	<p>From the above graph, deduce the relationship between <math>K_p</math> and <math>T</math>. [1]</p> <p>When one increases, the other decreases/inversely related/inverse relationship.</p>	
	(ii)	<p>Hence, explain whether the reaction between silver oxide and carbon dioxide is exothermic or endothermic. [2]</p> <p>The reaction is exothermic. Explanation: as the <math>T</math> increases/decreases, <math>K_p</math> decreases/increases, implying that PoE shifted left/right, which further implies that the backward reaction is endothermic/forward reaction is exothermic.</p>	

5	(a)	(iii)	<p>Given that the straight line graph for <math>\ln K_p</math> versus <math>T^{-1}</math> is described by the equation</p> $\ln K_p = \left( \frac{-\Delta H^0}{R} \right) \frac{1}{T} + \frac{\Delta S^0}{R}$ <p>Calculate the standard entropy change of this reaction and explain the significance of its sign with respect to the reaction. [2]</p> <p>y-intercept = -19.5  <math>\Delta S = (-19.5) \times 8.31 = -162 \text{ J mol}^{-1} \text{ K}^{-1}</math>  The sign is negative because there is a decrease in the amount of gas. [</p>
			<p>After absorbing carbon dioxide for some time, most if not all of the silver oxide would have been depleted. To <b>recharge</b> the system, heat is applied into the system to form <math>\text{Ag}_2\text{O}</math> again.</p>
		(iv)	<p><math>\Delta G^0</math> and <math>K_p</math> are mathematically related by the equation</p> $\Delta G^0 = -RT \ln K_p$ <p>Using the graph, estimate the minimum temperature at which the <b>recharging</b> of this system becomes spontaneous. [1]</p> <p>x-intercept = <math>2 \times 10^{-3} \text{ K}^{-1}</math>  minimum temperature = <math>1 / (2 \times 10^{-3} \text{ K}^{-1}) = 500 \text{ K}</math></p>
5	(b)		<p>Silver carbonate (relative formula mass = 275.8) is a sparingly soluble salt. At <math>25^\circ\text{C}</math>, its solubility is <math>0.032 \text{ g dm}^{-3}</math> of water.</p>
		(i)	<p>Show that the value of the <math>K_{sp}</math> of silver carbonate at <math>25^\circ\text{C}</math> is <math>6.25 \times 10^{-12}</math>. [1]</p> <p><math>4(0.032 / 275.8)^3 = 6.25 \times 10^{-12} \text{ mol}^3 \text{ dm}^{-9}</math></p>
		(ii)	<p>Calculate the solubility of silver carbonate in <math>0.100 \text{ mol dm}^{-3}</math> silver nitrate at <math>25^\circ\text{C}</math>. [1]</p> <p><math>6.25 \times 10^{-12} = (0.100 + 2x)^2 x</math>  <math>x = 6.25 \times 10^{-10} \text{ mol dm}^{-3}</math></p>
		(iii)	<p><math>1.00 \text{ cm}^3</math> of a <math>1.20 \times 10^{-5} \text{ mol dm}^{-3}</math> silver nitrate solution was mixed with <math>3.00 \text{ cm}^3</math> of a <math>7.45 \times 10^{-5} \text{ mol dm}^{-3}</math> sodium carbonate solution.</p> <p>Determine whether there would be precipitation of silver carbonate. [2]</p> <p>Ionic Product = <math>(0.25 \times 1.20 \times 10^{-5})^2 (0.75 \times 7.45 \times 10^{-5})</math>  <math>= 5.03 \times 10^{-16} \text{ mol}^3 \text{ dm}^{-9}</math>  As <math>\text{IP} &lt; K_{sp}</math>, there will not be precipitate of silver carbonate.</p>

6	<p>The isocyanate functional group is a constitutional isomer of the fulminate, which was mentioned in question 5(c). The isocyanate has the carbon atom instead of nitrogen atom as the central atom.</p> <p>Isocyanates are important industrial chemicals; they react with alcohols to produce polyurethane polymers, which are components of polyurethane foams, thermoplastic elastomers and polyurethane paints.</p>		
(a)	This part is about the synthesis of a diisocyanate from methylbenzene.		
	 <p>Reaction scheme showing the synthesis of a diisocyanate from methylbenzene:</p> <p>Methylbenzene (toluene) reacts in <b>step I</b> with <math>\text{conc. H}_2\text{SO}_4 + \text{conc. HNO}_3</math> and heat to form intermediate <b>M</b> (<math>\text{C}_7\text{N}_2\text{H}_6\text{O}_4</math>).</p> <p>Intermediate <b>M</b> reacts in <b>step II</b> with <math>\text{conc. HCl} + \text{Zn}</math>, heat, followed by cold <math>\text{KOH (aq)}</math> to form 3,5-diaminotoluene.</p> <p>3,5-diaminotoluene reacts in <b>step III</b> with <math>\text{COCl}_2</math> to form 3,5-diisocyanatotoluene, labeled as <b>a diisocyanate</b>.</p>		
	(i)	State the type of reaction in step I. Electrophilic substitution.	[1]
	(ii)	Draw the structure of <b>M</b> . 	[1]

6	(a)	(iii)	<p>Draw the structure of the isomer of <b>M</b> which is formed as a side-product in step I. [1]</p> <div data-bbox="726 246 1093 492" data-label="Chemical-Block"> </div>
		(iv)	<p>Explain the purpose of KOH in step II. [1]</p> <p>It is to liberate the amine from its protonated form.</p> <p>It is to form the amine from its protonated form.</p>
		(v)	<p>Write a balanced equation for the overall reaction in step II. You are to use [H] to balance the equation. [1]</p> <div data-bbox="470 851 1340 1176" data-label="Chemical-Block"> </div>
		(vi)	<p>State the type of reaction in step III. [1]</p> <p>Condensation / addition-elimination</p>
6	(b)	Examine the synthetic route below.	

**Q**  
R<sub>3</sub>C<sub>3</sub>N<sub>3</sub>O<sub>3</sub>HCl
