

# **Definitions (Pure Chemistry)**

# Mole Concept

|   |  |
|---|--|
| <b>Relative Atomic Mass (<math>A_r</math>)</b>    | The average mass of one atom of an element when compared with $1/12$ the mass of one atom of carbon-12.                              |
| <b>Relative Molecular Mass (<math>M_r</math>)</b> | The average mass of one molecule of a substance when compared with $1/12$ the mass of one atom of carbon-12.                         |
| <b>Mole</b>                                       | One mole of a substance contains the same number of particles as the number of atoms in 12 grams of carbon-12.                       |
| <b>Molar Mass</b>                                 | The mass of one mole of any substance.   |
| <b>Avogadro's Law</b>                             | Avogadro's Law states that equal volumes of all gases, under the same temperature and pressure contain the same number of particles. |
| <b>Empirical Formula</b>                          | Empirical formula shows the simplest ratio of the different types of atoms in a compound.  |
| <b>Molecular Formula</b>                          | Molecular formula shows the exact number of each element in a compound.  |
| <b>Structural Formula</b>                         | Structural formula shows how the atoms are joined together in a compound.  |
| <b>Limiting Reactant</b>                          | The limiting reactant is the reactant that is completely used up in a reaction and it limits the amount of products formed.          |

# Atomic Structure

|                       |  |
|-----------------------|--|
| <b>Element</b>        | An element is a pure substance that cannot be broken down into simpler substances by chemical means.                   |
| <b>Compound</b>       | A compound is a pure substance that contains two or more different elements, chemically combined together.             |
| <b>Mixture</b>        | A mixture contains two or more substances that are not chemically combined together.                                   |
| <b>Molecule</b>       | A group of two or more atoms that are chemically combined.   |
| <b>Atom</b>           | The smallest particles of an element.  |
| <b>Isotope</b>        | An isotope is an atom of the same element with different number of neutrons, but same number of protons and electrons. |
| <b>Proton Number</b>  | The number of protons in the atom.   |
| <b>Nucleon Number</b> | The number of protons and neutrons in the atom.  |

# Chemical Bonding

|                                   |   |
|-----------------------------------|---|
| <b>Ionic Bond</b>                 | Strong electrostatic force of attraction between oppositely charged ions.   |
| <b>Covalent Bond</b>              | Bond formed by the sharing of at least one pair of valence electrons between atoms.   |
| <b>Giant Ionic Lattice</b>        | Large number of oppositely charged ions arranged in a repetitive, orderly manner, held in place by strong ionic bonds           |
| <b>Simple Molecular Structure</b> | Small molecules with strong covalent bonds within the molecule, but weak intermolecular forces of attraction between molecules. |

# Acids & Bases

|                    |   |
|--------------------|---|
| <b>Acid</b>        | A substance that produces $H^+$ ions when dissolved in water.                           |
| <b>Base</b>        | Any metal oxide or hydroxide that reacts with an acid to produce a salt and water only. |
| <b>Alkali</b>      | A substance that produces $OH^-$ ions when dissolved in water.                          |
| <b>Strong Acid</b> | An acid that dissolves in water to produce a high concentration of $H^+$ ions.          |
| <b>Weak Acid</b>   | An acid that dissolves in water to produce a low concentration of $H^+$ ions.           |
| <b>Salt</b>        | A salt contains a positive metal ion (or ammonium ion) and a negative non-metal ion.    |

# Redox

|                        |  |
|------------------------|--|
| <b>Redox Reaction</b>  | A reaction in which both reduction and oxidation take place.   |
| <b>Oxidation</b>       | A substance is oxidised when it gains oxygen in a chemical reaction.                                     |
| <b>Reduction</b>       | A substance is reduced when it loses oxygen in a chemical reaction.                                      |
| <b>Oxidising Agent</b> | A substance that causes another reactant to go through oxidation, while undergoing reduction themselves. |
| <b>Reducing Agent</b>  | A substance that causes another reactant to go through reduction, while undergoing oxidation themselves. |

# Chemical Reactions

|                         |  |
|-------------------------|--|
| <b>pH</b>               | A measure of acidity or alkalinity of a substance in aqueous solution.               |
| <b>Indicator</b>        | An organic compound which changes in colour in accordance with the pH of a solution. |
| <b>Acidic Oxide</b>     | An oxide that reacts with alkalis to produce salt and water only.                    |
| <b>Basic Oxide</b>      | An oxide that reacts with acids to produce salt and water only.                      |
| <b>Amphoteric Oxide</b> | An oxide that reacts with both acids and alkalis to produce salt and water only.     |
| <b>Neutral Oxide</b>    | An oxide that does not react with acids or alkalis.                                  |

# Energetics

|                             |  |
|-----------------------------|--|
| <b>Enthalpy Change</b>      | The overall heat change in a reaction.                     |
| <b>Exothermic Reaction</b>  | A reaction in which heat is given out to the surroundings. |
| <b>Endothermic Reaction</b> | A reaction in which heat is absorbed by the surroundings.  |

# Rate of Reaction

|                          |  |
|--------------------------|--|
| <b>Activation Energy</b> | The minimum energy that reacting particles must possess in order for a chemical reaction to occur.   |
| <b>Catalyst</b>          | A substance that will increase the rate of a reaction by lowering the activation energy. Once activation Energy is lowered, more reacting particles have energy greater or equal to the activation Energy. |
| <b>Haber Process</b>     | An industrial application for the production of ammonia.   |

# Electrolysis

|                         |   |
|-------------------------|---|
| <b>Electrolysis</b>     | The process of using electricity to break down or decompose a compound.         |
| <b>Electrolyte</b>      | A molten or aqueous compound that conducts an electric current.                 |
| <b>Electrode</b>        | A metal or carbon rod by which the current leaves or enters the electrolyte.    |
| <b>Inert Electrode</b>  | Electrodes that do not react with the products of electrolysis.                 |
| <b>Non-Electrolytes</b> | Substances that do not conduct electricity under any conditions.                |
| <b>Electroplating</b>   | The deposition of a thin layer of metal on an object, by means of electrolysis. |
| <b>Simple Cell</b>      | A device that converts chemical energy into electrical energy.                  |

# Organic Chemistry

|                                    |  |
|------------------------------------|--|
| <b>Homologous Series</b>           | Family of compounds with the same functional group, general formula and similar chemical properties. |
| <b>Functional Group</b>            | A group of atoms responsible for the characteristic reactions of a particular compound.              |
| <b>General Formula</b>             | A formula that represents a homologous series of compounds using letters and numbers.                |
| <b>Hydrocarbon</b>                 | A compound that contains only carbon and hydrogen atoms.   |
| <b>Saturated Hydrocarbon</b>       | A hydrocarbon that only contains single bonds between carbon atoms.                                  |
| <b>Monomer</b>                     | A molecule that can be bonded to other identical molecules to form a polymer.                        |
| <b>Polymer</b>                     | A large molecule made up of repeating subunits known as monomers.                                    |
| <b>Addition Polymerisation</b>     | A process in which monomers join together to form a large polymer without losing any atoms.          |
| <b>Condensation Polymerisation</b> | A process in which monomers join together to form a large polymer, producing water.                  |
