

**RIVER VALLEY HIGH SCHOOL**  
**2023 SEC 3 END-OF-YEAR EXAMINATION**

**CHEMISTRY**

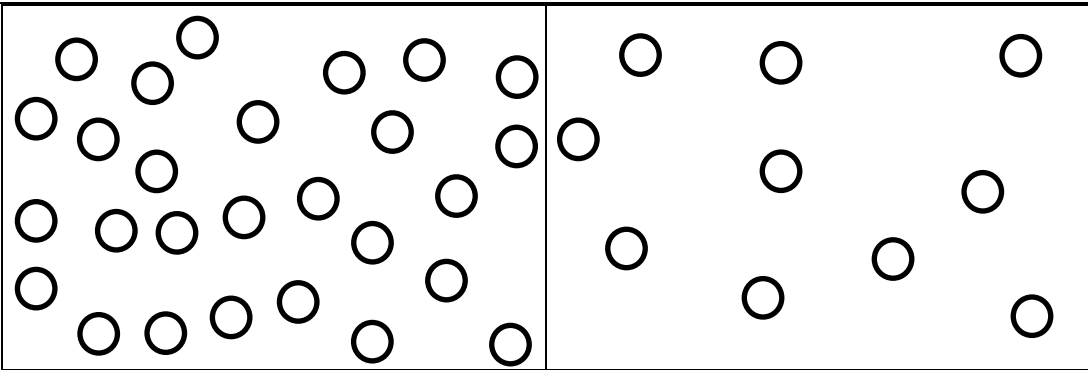

**Paper 1**

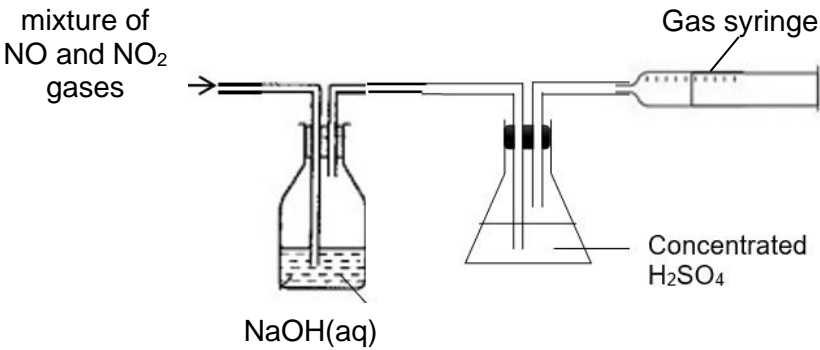

1	2	3	4	5	6	7	8	9	10
C	B	D	A	C	B	D	D	D	B
11	12	13	14	15	16	17	18	19	20
D	D	D	C	B	B	B	A	C	D
21	22	23	24	25	26	27	28	29	30
D	B	D	A	A	B	B	B	A	A

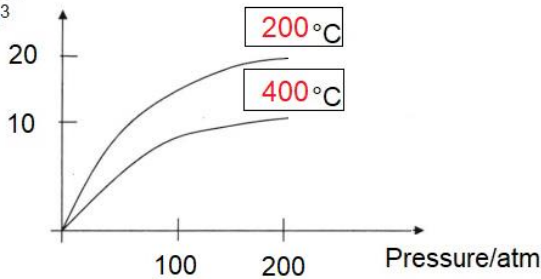

**Paper 2**

**Section A**

<b>A1</b>	<b>(a)</b>	A and E
	<b>(b)</b>	D and E
	<b>(c)</b>	B and F
	<b>(d)</b>	D

<b>A2</b>	<b>(a)</b>	 <div style="display: flex; justify-content: space-around; margin-top: 5px;"> <span>Box A</span> <span>Box B</span> </div>
	<b>(b)</b>	At a <u>lower temperature</u> , particles lose KE, move slower and <u>closer together / more particles per unit volume</u> . This <u>increases air density and increases lift</u> , making it easier for the smaller plane to take off.

	(c)	<p>(i)</p>  <p>mixture of NO and NO<sub>2</sub> gases</p> <p>NaOH(aq)</p> <p>Concentrated H<sub>2</sub>SO<sub>4</sub></p> <p>Gas syringe</p>
		<p>(ii) Test the gas collected with a moist blue litmus paper. If the gas <b>does not cause the moist blue litmus paper to turn red</b>, it shows that there is no acidic gas present / absence of NO<sub>2</sub> gas.</p>

A3a	(i)	$\begin{array}{c} \times & \times & \circ \\ \times & \text{N} & \times & \circ & \text{N} & \circ \\ \times & & \times & \circ & & \circ \\ & & \times & \circ & & \circ \end{array}$
	(ii)	<p>volume of NH<sub>3</sub>/cm<sup>3</sup></p>  <p>200 °C</p> <p>400 °C</p> <p>100 200 Pressure/atm</p> <p>Fig 1.1</p>
	(iii)	<p><math>\text{N}_2 \equiv 3\text{H}_2</math></p> <p>H<sub>2</sub> is the limiting reagent</p> <p>Theoretical yield = <math>300/3 \times 2 = 200 \text{ cm}^3</math></p> <p>Actual yield = <math>20.0 \text{ cm}^3</math></p> <p>% yield = <math>20/200 \times 100 = 10.0\%</math></p>
	(iv)	<p>Increase the pressure / Lower the temperature</p>
	(b)	<p><math>2\text{NH}_3 + \text{H}_2\text{SO}_4 \rightarrow (\text{NH}_4)_2\text{SO}_4</math></p>
	c(i)	<p><math>n_{\text{NH}_3} = [4800/1000] / 24 = 0.2000 \text{ mol}</math></p> <p><math>n_{\text{H}_2\text{O}} = 7.20 / [2(1.0) + 16.0] = 0.4000 \text{ mol}</math></p> <p><math>x = 0.2000 / 0.100 = 2</math></p> <p><math>y = 0.4000 / 0.100 = 4</math></p> <p>Hence, N<sub>2</sub>O<sub>4</sub></p>
	c(ii)	<p>NO<sub>2</sub></p>

A4a	(i)	<u>Aqueous iodine</u> is brown		
	(ii)	Na <sub>2</sub> SO <sub>4</sub> or sodium sulfate <b>I</b>		
	(iii)	element	oxidation state in reactant	oxidation state in product
		copper	<b>+2</b>	<b>+1</b>
		iodine	<b>-1</b>	<b>0</b>
	(iv)	<u>Copper</u> . Cu <sup>2+</sup> /Cu/ Copper/CuSO <sub>4</sub> <b>gained electrons</b>		
b	(i)	Manganese / Mn / MnO <sub>4</sub> <sup>-</sup> is <b>reduced</b> as the <b>oxidation state of Mn decreased from +7 in MnO<sub>4</sub><sup>-</sup> to +6 in MnO<sub>4</sub><sup>2-</sup></b>		
	(ii)	MnO <sub>4</sub> <sup>2-</sup> + ... <b>2</b> ...H <sub>2</sub> O + ... <b>2</b> ...e <sup>-</sup> → MnO <sub>2</sub> + 4OH <sup>-</sup>		
	(iii)	MnO <sub>2</sub> is an <b>insoluble</b> solid		
	(iv)	Substance X is a <b>reducing</b> agent		

A5	(a)	2 <sup>nd</sup> series coin – <b>aluminium &amp; bronze</b> . <b>Al has a relatively low / lowest density</b> of 2700 kg/m <sup>3</sup> compared to other metals		
	(b)	Both 1 <sup>st</sup> and 2 <sup>nd</sup> series of coins are made of alloys. In an alloy, the <b>different size of atoms disrupts the orderly arrangement</b> of atoms in pure metals. Hence, the <b>layer of atoms cannot slide easily</b> in an alloy (brass vs copper) . Hence coins made from mixture of metals are <b>stronger / harder</b> .		
	(c)	<b>Copper</b> has a <b>higher melting point (1083°C)</b> than <b>brass (950°C)</b> OR <b>iron (1536°C)</b> has a <b>higher melting point</b> than <b>steel (1510°C)</b> .		
	d(i)	A lot of energy is required to overcome the <b>strong electrostatic attraction between metal cations and (sea of) delocalised / mobile valence electrons</b> . Hence it does not have the ability to expand upon heating.		
	(ii)	Diamond has a <b>giant covalent structure</b> while poly(tetrafluoroethene) has a <b>macromolecular structure</b> . <b>More energy</b> is required to overcome the stronger <b>covalent bonds between the carbon atoms</b> than the weaker <b>intermolecular forces of attraction between the poly(tetrafluoroethene) molecules</b> . Hence, diamond has a lower CTE than poly(tetrafluoroethene).		
	(iii)	<ul style="list-style-type: none"> <li>• Hard</li> <li>• Non-conductor of electricity</li> <li>• Insoluble in all solvents / water</li> <li>• High melting &amp; boiling points</li> </ul>		

## Section B

<b>B6</b>	<b>(a)</b>	A weak acid is a substance that <b><u>partially ionises / dissociates in water</u></b> to <b><u>produce / form H<sup>+</sup></u></b> ions.	
	<b>(b)</b>	$\text{H}_2\text{CO}_3 (\text{aq}) \rightleftharpoons \text{H}^+ (\text{aq}) + \text{HCO}_3^- (\text{aq})$	
	<b>(c)</b>	Ocean acidification would also <b><u>dissolve / react</u></b> with the shells of calcifying organisms. Carbonic <b><u>acid</u></b> can <b><u>react with calcium carbonate to form calcium bicarbonate</u></b> (soluble in water), water and carbon dioxide.	
	<b>(d)</b>	<b>(i)</b>	Sodium chloride / NaCl <b><u>and</u></b> sodium carbonate / $\text{Na}_2\text{CO}_3$ These <b><u>salts are soluble</u></b> in water. The <b><u>reagents</u></b> that are used to make these salts are also <b><u>soluble</u></b> in water.
		<b>(ii)</b>	<b><u>Repeat</u></b> the titration <b><u>without using the indicator</u></b> . <b><u>Evaporate</u></b> the resulting mixture / aliquot to dryness.

<b>B7</b>	<b>(a)</b>	Solution P	
	<b>(b)</b>	$\text{RNH}_2 (\text{g}) + \text{H}_2\text{O} (\text{aq}) \rightleftharpoons \text{RNH}_3^+ (\text{aq}) + \text{OH}^- (\text{aq})$	
	<b>(c)</b>	<b>(i)</b>	Solution P is <b><u>neutral</u></b> as the universal indicator is green in colour. Solution P has the <b><u>same number / concentration of H<sup>+</sup> ions and OH<sup>-</sup> ions</u></b> .
	<b>(d)</b>	<b>(i)</b>	<b><u>The solubility of Group 2 sulfates decreases down the group</u></b> .
		<b>(ii)</b>	$9.44 \times 10^{-6}$ Accept: any value in the range of $10^{-6}$ .
		<b>(ii)</b>	Add an <b><u>excess</u></b> of magnesium oxide/ magnesium hydroxide/ magnesium/ magnesium carbonate to dilute sulfuric acid until no more solid dissolves / no more effervescence observed. <b><u>Filter</u></b> to collect the <b><u>filtrate</u></b> . <b><u>Evaporate</u></b> the filtrate to dryness.
