Preliminary Examination  
Paper 1 Multiple Choice

29 August 2014  
1 hour

Additional Materials:    Data Booklet  
                                  Optical Mark Sheet (OMS)

---

**READ THESE INSTRUCTIONS FIRST**

Write in soft pencil.

Do not use staples, paper clips, highlighters, glue or correction fluid.

Write your name, FIN/NRIC number and class on the OMS in the spaces provided.

Shade correctly FIN/NRIC number and your class.

Eg. If your NRIC is S9306660Z, shade **S9306660Z** for the item "index number".

There are **forty** questions in this paper. Answer **all** questions. For each question there are four possible answers **A, B, C** and **D**.

Choose the one you consider correct and record your choice using a **soft pencil** on the separate OMS.

Each correct answer will score one mark. A mark will not be deducted for a wrong answer. Any rough working should be done in this question paper.

This document consists of **22** printed pages and **0** blank page.

## Section A

For each question there are four possible answers, **A**, **B**, **C** and **D**. Choose the one you consider to be correct.

<b>1</b>	<p>The hydrolysis of <math>\text{S}_2\text{Cl}_2</math> proceeds by two reactions.</p> <p>Reaction 1     <math>\text{S}_2\text{Cl}_2 + 2\text{H}_2\text{O} \longrightarrow \text{H}_2\text{S} + \text{SO}_2 + 2\text{HCl}</math></p> <p>Reaction 2     <math>2\text{H}_2\text{S} + \text{SO}_2 \longrightarrow \frac{3}{8}\text{S}_8 + 2\text{H}_2\text{O}</math></p> <p>Which of the following correctly describe the reactions?</p>
<b>A</b>	A weakly acidic solution is formed in Reaction 1.
<b>B</b>	Reverse disproportionation occurs in Reaction 2.
<b>C</b>	The oxidation state of chlorine and oxygen changes in both reactions.
<b>D</b>	The products of Reaction 1 require 2 mol of NaOH for complete neutralisation.
	<p><b>Ans: B</b></p> <ul style="list-style-type: none"> <li>• Strong acid HCl is formed.</li> <li>• <math>\text{H}_2\text{S}</math> is oxidised to <math>\text{S}_8</math> while <math>\text{SO}_2</math> is reduced to <math>\text{S}_8</math> (the reverse of disproportionation reaction).</li> <li>• Oxidation states of chlorine and oxygen remain as <math>-1</math> and <math>-2</math> in both reactions.</li> <li>• <math>2\text{HCl} + 2\text{NaOH} \rightarrow 2\text{NaCl} + 2\text{H}_2\text{O}</math>  <math>\text{SO}_2 + \text{H}_2\text{O} \rightarrow \text{H}_2\text{SO}_3</math>  <math>\text{H}_2\text{SO}_3 + 2\text{NaOH} \rightarrow \text{Na}_2\text{SO}_3 + 2\text{H}_2\text{O}</math>  Total amount of NaOH required = 4 mol</li> </ul>

<b>2</b>	<p>Sodium carbonate peroxyhydrate with the formula <math>(\text{Na}_2\text{CO}_3)_x \cdot y \text{H}_2\text{O}_2</math> is used in eco-friendly cleaning products and as a laboratory source of anhydrous hydrogen peroxide.</p> <p>When <math>20.0 \text{ cm}^3</math> of <math>0.100 \text{ mol dm}^{-3}</math> sodium carbonate peroxyhydrate is titrated with <math>0.200 \text{ mol dm}^{-3}</math> acidified <math>\text{KMnO}_4</math>, it requires <math>12.0 \text{ cm}^3</math> of acidified <math>\text{KMnO}_4</math> before the first pink colour appears.</p> $2\text{MnO}_4^- + 6\text{H}^+ + 5\text{H}_2\text{O}_2 \longrightarrow 2\text{Mn}^{2+} + 8\text{H}_2\text{O} + 5\text{O}_2$ <p>When an identical sample is acidified, it releases <math>96.0 \text{ cm}^3</math> of carbon dioxide at room conditions.</p>
----------	--

	What is the ratio of <b>x:y</b> ?
<b>A</b>	1 : 3
<b>B</b>	2 : 3
<b>C</b>	2 : 1
<b>D</b>	3 : 1
<b>Ans: B</b>  Amt of $\text{MnO}_4^-$ used = 0.002400 mol  Amt of $\text{H}_2\text{O}_2$ present = $0.002400 / 2 \times 5 = 0.006000$ mol  Amt of sodium carbonate peroxyhydrate = 0.002000 mol  $y = 0.006 / 0.002 = \underline{3}$  $\text{Na}_2\text{CO}_3 + 2\text{H}^+ \rightarrow \text{CO}_2 + \text{H}_2\text{O} + 2\text{Na}^+$  Amt of $\text{CO}_2 = 0.096 / 24 = 0.004000$ mol  $x = 0.004 / 0.002 = \underline{2}$	

<b>3</b>	The successive ionisation energies, in $\text{kJ mol}^{-1}$ , of an element <b>E</b> are given below.  <div style="text-align: center;">             578      1820      2750      11600      14800      18400           </div> Which of the following could be the electronic configuration of the outermost shell in <b>E</b> ?
<b>A</b>	$ns^2$
<b>B</b>	$ns^2 np^1$
<b>C</b>	$ns^2 np^2$
<b>D</b>	$ns^2 np^3$
<b>Ans: B</b>  Largest increase is between the 3 <sup>rd</sup> and 4 <sup>th</sup> IE, hence this is a Group III element. Therefore, the outermost shell electronic configuration is $ns^2 np^1$	

- 4 The diagram represents the melting points of four consecutive elements in the third period of the Periodic Table.

The sketches below represent another two properties of the elements.

Which of the following represents the properties **F** and **G**?

		property <b>F</b>	property <b>G</b>
<b>A</b>		third ionisation energy	electronegativity
<b>B</b>		number of valence electrons	boiling point
<b>C</b>		ionic radius	effective nuclear charge
<b>D</b>		electrical conductivity	atomic radius

**Ans: A**

Based on the melting point data, the four elements are Si (Group IV) (high melting point due to giant molecular structure), P<sub>4</sub> (Group V), S<sub>8</sub> (Group VI) and Cl<sub>2</sub> (Group VII).

Property **F** is 3<sup>rd</sup> IE as there is an anomaly at Group V:

	Electron from $P^{2+}$ is removed from an outer subshell and hence less energy is required.
	Property <b>G</b> is electronegativity as electronegativity increases across the period.

<b>5</b>	Two identical bulbs at the same temperature contain ideal gases <b>J</b> and <b>K</b> separately. The density of gas <b>J</b> is twice that of gas <b>K</b> and the molecular mass of gas <b>J</b> is half that of gas <b>K</b> .  What is the ratio of the pressure of gas <b>J</b> to that of gas <b>K</b> ?
<b>A</b>	1 : 2
<b>B</b>	1 : 1
<b>C</b>	2 : 1
<b>D</b>	4 : 1
<b>Ans: D</b>  $PV = nRT$ $PM = \frac{m}{V} RT$ $P = \frac{\rho RT}{M}$  $\frac{P_J}{P_K} = \frac{\frac{2\rho_J}{\frac{1}{2}M_K}}{\frac{\rho_J}{M_K}} = \frac{4}{1}$	

<b>6</b>	Which of the following statements about an ideal gas are correct?
<b>A</b>	One mole of any ideal gas occupies the same volume under the same conditions of temperature and pressure.
<b>B</b>	The density of an ideal gas at constant pressure is directly proportional to the temperature.
<b>C</b>	The volume of a given mass of an ideal gas is doubled when its temperature is raised from 25 °C to 50 °C.
<b>D</b>	The temperature of a given mass of an ideal gas is doubled when its volume is raised from 0.05 cm <sup>3</sup> to 0.1 dm <sup>3</sup> .

**Ans: A**

A ✓  $PV = nRT$

B ✗  $\rho = \frac{PM}{RT}$  density is inversely proportional to temperature.

C ✗ Temperature is in kelvin so it is not doubled, thus volume is not doubled also.

D ✗  $0.1 \text{ dm}^3$  is 2000 times of  $0.05 \text{ cm}^3$  so temperature should increase by 2000 times.

**7** The type of bonding between two elements can be rationalised and even predicted using a van Arkel triangle. The triangle is based on electronegativity values. Difference in electronegativity is plotted along the y-axis and average electronegativity is plotted along the x-axis.

What is the type of bonding present at each of these bonding extremes, labelled **L**, **M** and **N** on the triangle?

	<b>L</b>	<b>M</b>	<b>N</b>	
<b>A</b>	covalent	metallic	ionic	
<b>B</b>	metallic	covalent	ionic	
<b>C</b>	covalent	ionic	metallic	
<b>D</b>	ionic	covalent	metallic	

**Ans: B**

Difference in electronegativity is zero for **L** & **M**  $\Rightarrow$  metallic bonding or covalent bonding.

Since metals have low electronegativity  $\Rightarrow$  **L** is metallic bonding.

8	<p>Lead is the final product formed by a series of changes in which the rate-determining stage is the radioactive decay of uranium-238. This radioactive decay is a first-order reaction with a half-life of <math>4.5 \times 10^9</math> years.</p> <p>What would be the age of a rock sample, originally lead-free, in which the molar proportion of uranium to lead is now 1:31?</p>
A	$2.25 \times 10^{10}$ years
B	$2.70 \times 10^{10}$ years
C	$3.15 \times 10^{10}$ years
D	$3.60 \times 10^{10}$ years
<p><b>Ans: A</b></p> <p>Uranium-238 is reactant; lead is product.</p> <p><u>Use formula:</u>          Since Uranium:lead = 1:31  <math>\Rightarrow 1+31 = 32</math> parts  <math>\left(\frac{1}{2}\right)^n = \left(\frac{1}{32}\right) = \left(\frac{1}{2}\right)^5</math> where <math>n = \text{no. of } t_{1/2} = 5</math></p> <p><math>\therefore \text{Age} = 5 \times 4.5 \times 10^9 = \mathbf{2.25 \times 10^{10} \text{ years}}</math></p>	

9	<p>When 0.1 mol of bismuth chloride is added to <math>2 \text{ dm}^3</math> of water, it reacts to form 0.02 mol of white precipitate of bismuth oxychloride and a solution of hydrochloric acid.</p> <p>The equation for the reaction is as follows:</p> $\text{BiCl}_3 (\text{aq}) + \text{H}_2\text{O} (\text{l}) \rightleftharpoons \text{BiOCl} (\text{s}) + 2\text{HCl} (\text{aq})$ <p>What is the correct expression for the equilibrium constant <math>K_c</math>?</p>
A	$\frac{(2 \times 0.02)^2}{0.08}$
B	$\frac{(0.02)(2 \times 0.02)^2}{0.08}$
C	$\frac{\left(\frac{2 \times 0.02}{2}\right)^2}{\frac{0.08}{2}}$
D	$\frac{\left(\frac{0.02}{2}\right)\left(\frac{2 \times 0.02}{2}\right)^2}{\frac{0.08}{2}}$

**Ans: C**

	$\text{BiCl}_3(\text{aq}) + \text{H}_2\text{O}(\text{l}) \rightleftharpoons \text{BiOCl}(\text{s}) + 2\text{HCl}(\text{aq})$			
Initial amt/mol	0.1			0
Change in amt/mol	-0.02		+0.02	+2(0.02)
Final amt/mol	0.08		0.02	2(0.02)

$$K_c = \frac{[\text{HCl}]^2}{[\text{BiCl}_3]} = \frac{\left(\frac{2 \times 0.02}{2}\right)^2}{\frac{0.08}{2}}$$

<b>10</b>	What is the pH of the resultant solution when 100 cm <sup>3</sup> of 0.10 mol dm <sup>-3</sup> of aqueous NH <sub>3</sub> and 80 cm <sup>3</sup> of 0.15 mol dm <sup>-3</sup> aqueous NH <sub>4</sub> Cl are mixed at 25 °C? (pK <sub>b</sub> of NH <sub>3</sub> = 4.75)			
	<b>A</b> 9.07	<b>B</b> 9.17	<b>C</b> 9.32	<b>D</b> 9.35

**Ans: B**

Mixing NH<sub>3</sub> and NH<sub>4</sub>Cl produces a basic buffer.

$$\text{pOH} = \text{pK}_b + \lg \frac{[\text{salt}]}{[\text{base}]} = 4.75 + \lg \left( \frac{0.080 \times 0.15}{0.100 \times 0.10} \right) = 4.83$$

$$\text{pH} = 14 - 4.83 = 9.17$$

<b>11</b>	Instant 'cold packs' are often used by athletes to conveniently treat injuries. One type of 'cold pack' is composed of powdered ammonium nitrate and water separated by a thin plastic membrane. When the pack is squeezed, the membrane breaks and ammonium nitrate dissolves in water spontaneously.  Which line in the table gives the signs of $\Delta H$ , $\Delta S$ and $\Delta G$ for the overall process?			
		$\Delta H$	$\Delta S$	$\Delta G$
	<b>A</b>	–	+	–
	<b>B</b>	–	–	+
	<b>C</b>	+	–	+
	<b>D</b>	+	+	–

**Ans: D**

- As this process is endothermic,  $\Delta H$  is positive.
- As the reaction occurs readily when solid dissolves in water, the reaction is

spontaneous. Therefore  $\Delta G$  is negative.

- $\Delta G = \Delta H - T\Delta S$

(-) (+)

$\Delta S$  must be positive so that the overall  $\Delta G$  is negative.

**12** Use of the Data Booklet is relevant to this question.

The half-cells for four metals: Mg, P, Q and R were in turn connected in pairs and the potential difference was recorded.

**Temperature = 25°C**

The results obtained are as shown in the table below.

Positive electrode	Negative electrode	e.m.f /V
P	Mg	+2.10
Q	Mg	+2.72
Mg	R	+0.33

Rank the four metals in the order of decreasing reducing power.

**A** Q > P > Mg > R

**B** P > Q > Mg > R

**C** R > Mg > P > Q

**D** R > Mg > Q > P

**Ans: C**

Positive electrode (Cathode) → [R]	Negative electrode (Anode) → [O]	e.m.f /V
---------------------------------------	-------------------------------------	----------

$$E_{\text{cell}}^{\ominus} = E_{\text{red}}^{\ominus} - E_{\text{oxid}}^{\ominus}$$

$$+2.10 = E_{\text{P}}^{\ominus} - (-2.38)$$

$$E_p^\ominus = -0.28\text{V};$$

Since  $-0.28\text{V}$  is less negative than  $-2.38\text{V}$ , **P** is more easily reduced  $\rightarrow$  less easily oxidised than Mg.

Apply the same method for **Q** and **R** to arrive at your answer.

**13** **W, X, Y** and **Z** are four elements in Period 3.

**W** is a conductor of electricity and does not react with water. **Z** forms a chloride,  $\text{ZCl}_5$  which reacts with water and dissolves in organic solvent. **Y** forms a solid oxide  $\text{YO}_2$ . **XOH** is a strong alkali.

Arrange the above elements in order of increasing proton number.

**A** **X, W, Y, Z**

**B** **X, Y, Z, W**

**C** **W, Y, X, Z**

**D** **W, X, Y, Z**

**Ans: A**

**W** (can conduct electricity) and **X** (forms strong alkali) are metals.

**X** is likely to be Na.

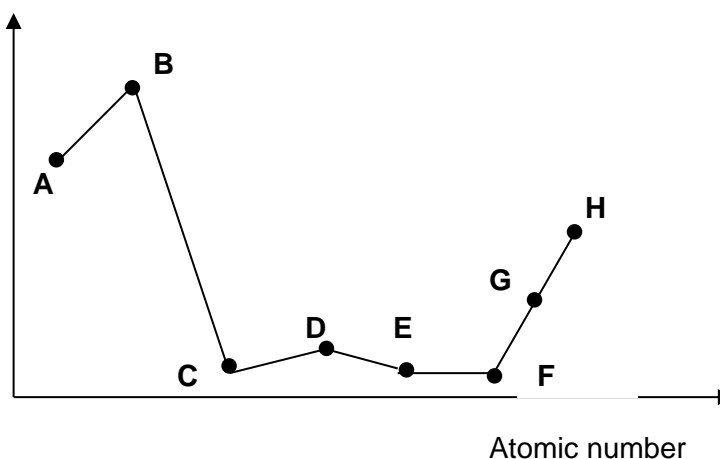

**W** is likely to be Al, as it does not react with water.

**Z** is likely to be phosphorus, due to  $\text{PCl}_5$  formed.

**Y** is likely to be Si, or Mg due to solid oxide  $\text{YO}_2$ .

**14** The graph below show the variation in the molar enthalpy change of vapourisation,  $\Delta H_{\text{vap}}$  for 8 consecutive elements in the Periodic Table, all with atomic number  $\leq 20$ .

$\Delta H_{\text{vap}} / \text{kJ mol}^{-1}$

What can be deduced from the above graph?

	<b>A</b>	Element <b>A</b> forms amphoteric oxides.
	<b>B</b>	Element <b>F</b> exists as diatomic molecules.
	<b>C</b>	Element <b>G</b> forms an oxide which is acidic in aqueous solution.
	<b>D</b>	Element <b>C</b> is in the same group as boron in the Periodic Table.
<b>Ans: A</b> Based on the graph, the sharp dip signifies that <b>C</b> , <b>D</b> , <b>E</b> and <b>F</b> are simple molecular compounds. <b>C</b> , <b>D</b> , <b>E</b> and <b>F</b> are likely to be $P_4$ , $S_8$ , $C_{12}$ and Ar respectively. Hence, <b>A</b> and <b>B</b> are Al and Si respectively.		

<b>15</b>	Radium is the last element in Group II in the Periodic Table. Which of the following is <b>not</b> true for radium?	
	<b>A</b>	Its oxide is basic with water.
	<b>B</b>	It is the least reactive element in Group II.
	<b>C</b>	It reacts with water to release hydrogen gas.
	<b>D</b>	Its compounds conduct electricity when molten.
<b>Ans: B</b> Radium is the most reactive element in Group II as the 2 electrons are the most easily removed as the electrons are the furthest away due to the most number of quantum shells. Hence the electrostatic force of attraction between the nucleus and outer electrons is the weakest.		

<b>16</b>	Which of the following factors best explains why magnesium sulfate has a higher solubility than barium sulfate?	
	<b>A</b>	Barium is more electropositive than magnesium.
	<b>B</b>	The charge density of magnesium ions is greater than that of the barium ions.
	<b>C</b>	Magnesium sulfate has numerically larger lattice energy than barium sulfate.
	<b>D</b>	The hydration of barium ions is more exothermic than that of magnesium ions.
<b>Ans: B</b> L.E. $\propto \left  \frac{q^+ q^-}{r^+ r^-} \right $ Statement <b>A</b> is true but does not explain why magnesium sulfate is more		

	<p>soluble. In fact, it shows that magnesium sulfate is highly insoluble due to its strong lattice structure.</p> <p>Charge density <math>\propto \frac{\text{charge}}{\text{size}}</math></p> <p>Statement <b>B</b> is true as the cationic size of <math>\text{Mg}^{2+}</math> is smaller than <math>\text{Ba}^{2+}</math> hence charge density of <math>\text{Mg}^{2+}</math> is greater than that of <math>\text{Ba}^{2+}</math>. This implies that hydration of <math>\text{Mg}^{2+}</math> is more exothermic than <math>\text{Ba}^{2+}</math> and hence <math>\Delta H_{\text{sol}}</math> of <math>\text{MgSO}_4</math> will be more negative than <math>\Delta H_{\text{sol}}</math> of <math>\text{BaSO}_4</math>. Therefore, <math>\text{MgSO}_4</math> is more soluble than barium sulphate.</p> $\Delta H_{\text{sol}} = \Delta H_{\text{hyd}} - \text{L.E}$ <p>Statement <b>C</b> is true but does not explain why magnesium sulphate is more soluble.</p> <p>Statement <b>D</b> is not true. Hydration of <math>\text{Mg}^{2+}</math> is more exothermic than <math>\text{Ba}^{2+}</math> due to the smaller cationic radius of <math>\text{Mg}^{2+}</math>.</p> $\Delta H_{\text{hyd}} \propto \left  \frac{q^+}{r^+} \right $
--	--

<b>17</b>	<p>Concentrated sulfuric acid reacts differently with each of the sodium halides, <math>\text{NaCl}</math>, <math>\text{NaBr}</math> and <math>\text{NaI}</math> due to their differing chemical properties.</p> <p>Which of the following statements about their respective reactions is <b>not</b> true?</p>
<b>A</b>	Sodium halides may act as reducing agents.
<b>B</b>	White fumes are produced in the reactions involving sodium bromide and sodium iodide only.
<b>C</b>	Redox reaction occurred with concentrated sulfuric acid only for sodium bromide and sodium iodide.
<b>D</b>	There is a difference in the extent of the reduction of the sulfuric acid when the reactions of bromide and iodide with concentrated sulfuric acid are compared.
	<p><b>Ans: B</b></p> <p>A is true. <math>\text{NaX}</math> may act as reducing agent. Reducing power decreases down the group from <math>\text{NaCl}</math> to <math>\text{NaBr}</math> to <math>\text{NaI}</math>. Thus, C and D are true.</p> <p>B is not true, as white fumes of <math>\text{HCl}</math> is also produced when <math>\text{NaCl}</math> reacts with concentrated sulfuric acid.</p>

**18** Consider the following reaction route.

$$\begin{array}{c} \text{T (aq)} \xrightarrow{\text{hot aqueous KOH}} \text{U (aq)} + \text{V (aq)} \\ \downarrow \text{AgNO}_3 \text{ (aq)} \\ \text{precipitate} \xrightarrow{\text{dilute NH}_3 \text{ (aq)}} \text{colourless solution} \end{array}$$

What could solutions **T**, **U** and **V** be?

	<b>T</b>	<b>U</b>	<b>V</b>
<b>A</b>	$\text{Cl}_2$	$\text{KCl}$	$\text{KClO}$
<b>B</b>	$\text{Cl}_2$	$\text{KCl}$	$\text{KClO}_3$
<b>C</b>	$\text{Br}_2$	$\text{KBr}$	$\text{KBrO}$
<b>D</b>	$\text{Br}_2$	$\text{KBr}$	$\text{KBrO}_3$

**Ans: B**

Since the precipitate may dissolve in dilute  $\text{NH}_3$  (aq) eventually, **T** is  $\text{Cl}_2$ .  
Since hot aqueous  $\text{KOH}$  is used, **V** is  $\text{KClO}_3$ .

**19** Use of the Data Booklet is relevant to this question.

Peroxodisulfate(VI),  $\text{S}_2\text{O}_8^{2-}$ , is capable of oxidising the tartrate ion,  $[\text{CH}(\text{OH})\text{CO}_2]_2^{2-}$  to carbon dioxide and methanoate as shown in the following reaction.

$$[\text{CH}(\text{OH})\text{CO}_2]_2^{2-} + 3\text{S}_2\text{O}_8^{2-} + 2\text{H}_2\text{O} \longrightarrow 2\text{CO}_2 + 2\text{HCO}_2^- + 6\text{H}^+ + 6\text{SO}_4^{2-}$$

The reaction can be catalysed by a homogenous catalyst. Given that the electrode potential for the tartrate ion is

$$2\text{CO}_2 + 2\text{HCO}_2^- + 6\text{H}^+ + 6\text{e}^- \rightleftharpoons [\text{CH}(\text{OH})\text{CO}_2]_2^{2-} + 2\text{H}_2\text{O} \quad E^\ominus = +0.56 \text{ V}$$

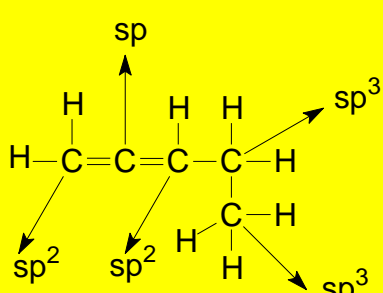

Which metal ion is **not** a suitable catalyst for this reaction?

<b>A</b>	$\text{Co}^{3+}$
<b>B</b>	$\text{Fe}^{3+}$
<b>C</b>	$\text{Mn}^{2+}$
<b>D</b>	$\text{V}^{2+}$

**Ans: D**

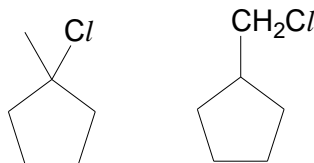

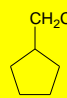

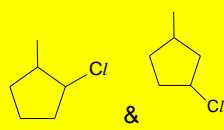

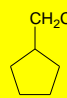

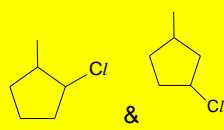

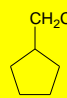

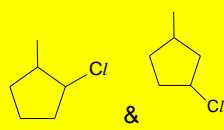

$\text{S}_2\text{O}_8^{2-} + 2\text{e}^- \rightleftharpoons 2\text{SO}_4^{2-}$	$E^\ominus = +2.01 \text{ V}$
$\text{Co}^{3+} + \text{e}^- \rightleftharpoons \text{Co}^{2+}$	$E^\ominus = +1.82 \text{ V}$
$\text{Fe}^{3+} + \text{e}^- \rightleftharpoons \text{Fe}^{2+}$	$E^\ominus = +0.77 \text{ V}$
$\text{Mn}^{3+} + \text{e}^- \rightleftharpoons \text{Mn}^{2+}$	$E^\ominus = +1.49 \text{ V}$
$\text{V}^{3+} + \text{e}^- \rightleftharpoons \text{V}^{2+}$	$E^\ominus = -0.26 \text{ V}$

	<p>Catalyst chosen must have a value between +0.56 V and +2.10 V in order to reduce <math>\text{S}_2\text{O}_8^{2-}</math> and to oxidize <math>[\text{CH}(\text{OH})\text{CO}_2]_2^{2-}</math>.</p> <p>Hence <math>\text{V}^{2+}</math> cannot be used.</p>
--	--

20	<p>Covalent bonds are formed by orbital overlap. The shape of unsaturated hydrocarbon molecules can be explained in terms of hybridisation of orbitals.</p> <p>Which bond is <b>not</b> present in <math>\text{CH}_2=\text{C}=\text{CHCH}_2\text{CH}_3</math>?</p>
A	$\pi$ bond formed by $\text{sp} - \text{sp}^2$ overlap
B	$\sigma$ bond formed by $\text{sp}^3 - \text{sp}^2$ overlap
C	$\sigma$ bond formed by $\text{s} - \text{sp}^3$ overlap
D	$\sigma$ bond formed by $\text{sp}^3 - \text{sp}^3$ overlap
<p><b>Ans: A</b></p>  <p><math>\pi</math> bond is formed via sideways overlap of unhybridised p orbitals <math>\rightarrow</math> Option A is incorrect</p> <p>In option C: 1s orbital refers to 1s orbital of H.</p>	

21	In which reaction will the oxidation number of carbon show the smallest change?
A	$\text{CH}_3\text{CH}(\text{OH})\text{CH}_3 \xrightarrow[\text{heat}]{\text{MnO}_4^- / \text{H}^+}$ <p>Note: refer to the C atom bonded to the <math>-\text{OH}</math> group</p>
B	$\begin{array}{c} \text{H} \\   \\ \text{H}-\text{C}-\text{OH} \\   \\ \text{H} \end{array} \xrightarrow[\text{heat}]{\text{K}_2\text{Cr}_2\text{O}_7 / \text{H}^+}$

	<b>C</b>	$\text{H}-\overset{\text{O}}{\underset{\text{H}}{\text{C}}} \xrightarrow[\text{heat}]{\text{excess O}_2}$
	<b>D</b>	$\text{CH}_2=\text{CH}_2 \xrightarrow[\text{heat}]{\text{H}_2, \text{Ni}}$
<p><b>Ans: D</b></p> <p>Option A: changes from 0 in <math>\text{RCH(OH)R}</math> to +2 (<math>\text{RCOR}</math>) <math>\rightarrow</math> +2</p> <p>Option B: changes from -2 (<math>\text{CH}_3\text{OH}</math>) to +2 (<math>\text{HCOOH}</math>) <math>\rightarrow</math> +4</p> <p>Option C: changes from 0 (<math>\text{HCHO}</math>) to +4 (<math>\text{CO}_2</math>) <math>\rightarrow</math> +4</p> <p>Option D: changes from -2 (<math>\text{CH}_2=\text{CH}_2</math>) to -3 (<math>\text{CH}_3\text{CH}_3</math>) <math>\rightarrow</math> -1</p>		

<b>22</b>	<p>Methylcyclopentane can react with chlorine via free radical substitution to produce a mixture of four monochlorinated products, two of which are shown below.</p> <div style="text-align: center;"></div> <p>For methylcyclopentane, the order of reactivity of tertiary and primary hydrogen atoms follows a 5 : 1 ratio.</p> <p>What is the likely ratio of tertiary <math>\text{RCI}</math> : primary <math>\text{RCI}</math> formed?</p>								
	<b>A</b>	1 : 15							
	<b>B</b>	1 : 3							
	<b>C</b>	3 : 5							
	<b>D</b>	5 : 3							
<p><b>Answer: D</b></p> <table border="1" style="width: 100%;"><tr><td style="text-align: center; padding: 10px;"> tertiary <math>\text{RCI}</math></td><td style="text-align: center; padding: 10px;"> primary <math>\text{RCI}</math></td><td style="text-align: center; padding: 10px;"> &amp; Other 2 products are secondary <math>\text{RCI}</math></td></tr><tr><td style="text-align: center; padding: 10px;">1 H each with reactivity of 5 = <b>5</b></td><td style="text-align: center; padding: 10px;">3 H each with reactivity of 1 = <b>3</b></td><td></td></tr></table>				 tertiary $\text{RCI}$	 primary $\text{RCI}$	 & Other 2 products are secondary $\text{RCI}$	1 H each with reactivity of 5 = <b>5</b>	3 H each with reactivity of 1 = <b>3</b>	
 tertiary $\text{RCI}$	 primary $\text{RCI}$	 & Other 2 products are secondary $\text{RCI}$							
1 H each with reactivity of 5 = <b>5</b>	3 H each with reactivity of 1 = <b>3</b>								

23	<p>Tryptophan is an amino acid and is essential to the human diet. It also serves as a biological precursor to some chemicals associated with the nervous system of the human body. It has an isoelectric point of 5.89.</p> <div style="text-align: center;">  <p><b>Tryptophan</b></p> </div> <p>What of the following statements is <b>not</b> true about tryptophan?</p>
	<p><b>A</b> There are a total of 2 stereoisomers present.</p>
	<p><b>B</b> It has a positive charge when placed in a solution at pH 3.</p>
	<p><b>C</b> It reacts with lithium aluminium hydride to form:</p> <div style="text-align: center;">  <p><math>\text{CH}_2\text{CH}(\text{NH}_2)\text{CH}_2\text{OH}</math></p> </div>
	<p><b>D</b> It reacts with aqueous bromine to form:</p> <div style="text-align: center;">  <p><math>\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}</math></p> </div>
	<p><b>Ans: C</b></p> <p><b>C</b> is not true as alkenes are reduced by hydrogen only, not lithium aluminium hydride.</p> <p><b>A</b> is true as Cis-trans isomerism is not observed for C=C on cyclic rings. 1 chiral carbon hence 2 optical isomers are possible.</p> <p><b>B</b> is true as since <math>\text{pH} &lt; \text{pI}</math>, Tryptophan becomes protonated in an acidic medium.</p>

**D** is true as the alkene reacts via electrophilic addition and the aromatic amine reacts via electrophilic substitution.

**24** 2-methylpropanoic acid can be synthesised from 1-chloropropane through a series of reactions.

Which set of reagents, used in sequential order, would be the most suitable for this synthesis?

**A** ethanolic KCN, dilute HCl

**B**  $\text{PCl}_5$ , acidified  $\text{KMnO}_4$

**C** aqueous KOH, HCl, ethanolic KCN, dilute HCl

**D** ethanolic KOH, HBr, ethanolic KCN, dilute  $\text{H}_2\text{SO}_4$

**Ans: D**

**25** Compound **J** exhibits the following characteristics:

- 1 mol of **J** reacts with excess sodium metal to form 1 mol of hydrogen gas.
- Yellow precipitate is formed when **J** reacts with aqueous alkaline iodine.
- Orange precipitate is formed when **J** reacts with 2,4-DNPH, but no reaction with alkaline silver diammine solution.
- **J** rotates plane-polarised light.

Which of the following could compound **J** be?

**B**

		<b>D</b>
	<p><b>Ans: C</b></p> <ul style="list-style-type: none"> <li>Option <b>A</b> is wrong because 1 mole of J reacts with Na metal to form 1 mol H<sub>2</sub> (g) infers that there are 2 –OH groups.</li> <li>Options <b>B</b> and <b>D</b> are wrong because yellow ppt with alkaline aq iodine infers positive iodoform test hence CH<sub>3</sub>CO or CH<sub>3</sub>CH(OH) must be present.</li> <li>Option <b>C</b> is reconfirmed as it has a chiral centre to rotate plane polarised light.</li> </ul>	

<b>26</b>	Ethanol reacts explosively with sodium metal to form a salt, sodium ethoxide.  What is the product of the reaction between 2-iodobutane and sodium ethoxide?	
	<b>A</b>	CH <sub>3</sub> CH=CHCH <sub>3</sub>
	<b>B</b>	(CH <sub>3</sub> ) <sub>2</sub> CHCH <sub>2</sub> OCH <sub>2</sub> CH <sub>3</sub>
	<b>C</b>	CH <sub>3</sub> CH <sub>2</sub> CH(OCH <sub>3</sub> )CH <sub>2</sub> CH <sub>3</sub>
	<b>D</b>	CH <sub>3</sub> CH <sub>2</sub> CH(CH <sub>3</sub> )OCH <sub>2</sub> CH <sub>3</sub>
	<p><b>Ans: D</b></p> $\text{CH}_3\text{CH}_2\text{OH} + \text{Na} \longrightarrow \text{CH}_3\text{CH}_2\text{O}^-\text{Na}^+$ $\text{CH}_3\text{CH}_2\text{O}^- + \begin{array}{c} \text{H} \\   \\ \text{CH}_3\text{CCH}_2\text{CH}_3 \\   \\ \text{I} \end{array} \longrightarrow \begin{array}{c} \text{H} \\   \\ \text{CH}_3\text{CCH}_2\text{CH}_3 \\   \\ \text{OCH}_2\text{CH}_3 \end{array}$	

27	<p>Deuterium, D, is the <math>^2_1\text{H}</math> isotope of hydrogen.</p> <p>Which reaction could give an organic compound having deuterium incorporated into the molecule?</p>
A	$\text{CH}_3\text{CD}_2\text{CH}(\text{Cl})\text{CH}(\text{CH}_3)_2 \xrightarrow{\text{NaOD (alc.)}}$
B	$\text{CH}_3\text{CH}_2\text{CN} \xrightarrow[\text{D}_2\text{O}]{\text{NaOD}}$
C	$\text{CH}(\text{CH}_3)_2\text{CH}_2\text{OD} + \text{DBr} \longrightarrow$
D	$\text{CH}_3\text{COCI}_3 \xrightarrow[\text{D}_2\text{O}]{\text{NaOD}}$
<p><b>Ans: D</b></p> <p><b>A</b> <math>\text{CH}_3\text{CD}_2\text{CH}(\text{Cl})\text{CH}(\text{CH}_3)_2 \longrightarrow \text{CH}_3\text{CD}_2\text{CH}=\text{C}(\text{CH}_3)_2 + \text{CH}_3\text{CD}=\text{CH}(\text{CH}_3)_2</math></p> <p><b>Type of reaction: elimination</b> Deuterium is NOT incorporated</p> <p><b>B</b> <math>\text{CH}_3\text{CH}_2\text{CN} \xrightarrow[\text{D}_2\text{O}]{\text{NaOD}} \text{CH}_3\text{CH}_2\text{COO}^-</math></p> <p><b>Type of reaction: basic hydrolysis</b> Deuterium is NOT incorporated</p> <p><b>C</b> <math>\text{CH}(\text{CH}_3)_2\text{CH}_2\text{OD} + \text{DBr} \longrightarrow \text{CH}(\text{CH}_3)_2\text{CH}_2\text{Br}</math></p> <p><b>Type of reaction: nucleophilic substitution</b> Deuterium is NOT incorporated</p> <p><b>D</b> <math>\text{CH}_3\text{COCI}_3 \longrightarrow \text{CH}_3\text{COO}^- + \text{CDI}_3</math></p> <p><b>Type of reaction: oxidation (iodoform)</b> Deuterium is incorporated</p> <p>Since deuterium is an isotope of hydrogen, the type of reaction that the various organic compounds are the same as when hydrogen is used.</p>	

**28** Safranal is a component of the yellow dyestuff saffron.

**Safranal**

What are the products of warming it with Tollens' reagent?

- |          |  |
|----------|--|
| <b>A</b> | a precipitate of silver oxide and a carboxylate salt |
| <b>B</b> | a silver mirror and a carboxylate salt               |
| <b>C</b> | a silver mirror and a carboxylic acid                |
| <b>D</b> | a silver mirror and an alcohol                       |

**Ans: B**

**29** Ferulic acid is an abundant phytochemical found in plant cell walls.

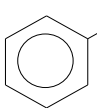

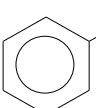

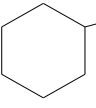

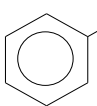

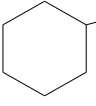

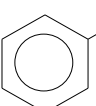

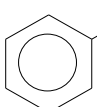

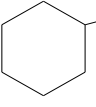

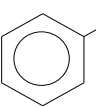

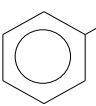

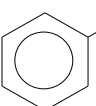

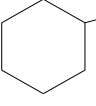

**Ferulic acid**

Assume that  $\text{CH}_3\text{O}-$  group is inert. Which statement about ferulic acid is correct?

- |          |   |
|----------|---|
| <b>A</b> | Ferulic acid can only undergo electrophilic addition with aqueous bromine.                  |
| <b>B</b> | Ferulic acid forms an ester with ethanoic acid when heated with concentrated sulfuric acid. |
| <b>C</b> | One mole of ferulic acid can react with only one mole of phosphorous pentachloride.         |
| <b>D</b> | Ferulic acid reacts with lithium aluminium hydride to form a product that                   |

	does not exhibit geometric isomerism.
<b>Ans: C</b>	Only the hydroxyl group in the carboxylic acid group in ferulic acid can undergo nucleophilic substitution with phosphorus pentachloride to form an acyl chloride.

<b>30</b>	Which of the following shows the correct order of increasing base strength?			
	<b>Weakest base</b>		<b>Strongest base</b>	
<b>A</b>			NH <sub>3</sub>	
<b>B</b>				NH <sub>3</sub>
<b>C</b>		NH <sub>3</sub>		
<b>D</b>	NH <sub>3</sub>			

**Ans: A**

is neutral; it is not basic.

is most basic because of its electron donating group from cyclohexane.

NH<sub>3</sub> is more basic than

because the lone pair of electrons is delocalised

into the benzene ring in  
to act as a base.

. This decreases the availability of the lone pair

## Section B

For **questions 31 – 40**, one or more of the numbered statements **1** to **3** may be correct. Decide whether each of the statements is or is not correct. The responses **A** to **D** should be selected on the basis of

A	B	C	D
1, 2 and 3 are correct	1 and 2 only are correct	2 and 3 only are correct	1 only is correct

No other combination of statements is to be used as correct response.

<b>31</b>	Which of the following contain more intermolecular hydrogen bonds than ammonia?
<b>1</b>	$\text{H}_2\text{SO}_4(l)$
<b>2</b>	$\text{CH}_3\text{COCH}_3(l)$
<b>3</b>	$\text{CH}_3\text{COOH}(l)$
<p><b>Ans: D (1 only)</b></p> <p><math>\text{NH}_3</math> forms 1 H-bond per molecule (3H but limited by only 1 lone pair of electrons per molecule)</p> <p><b>1</b> ✓ <math>\text{H}_2\text{SO}_4(l)</math>: 2H and 8 lone pairs <math>\Rightarrow</math> <b>2 H-bond</b> per molecule</p> <p><b>2</b> × <math>\text{CH}_3\text{COCH}_3(l)</math>: no intermolecular H-bonds present</p> <p><b>3</b> × <math>\text{CH}_3\text{COOH}(l)</math>: 1H and 4 lone pairs of both O atom <math>\Rightarrow</math> <b>1 H-bond</b> per molecule</p>	

<b>32</b>	<p>Consider the following mechanism.</p> $\text{L} + \text{M} \rightleftharpoons \text{N} \quad \text{fast}$ $\text{L} + \text{N} \longrightarrow \text{P} + \text{Q} \quad \text{slow}$ $\text{N} + \text{Q} \longrightarrow \text{M} + \text{P} \quad \text{fast}$ <p>What can be deduced from the mechanism?</p>
<b>1</b>	The unit for rate constant, $k$ , in the rate equation is $\text{mol}^{-1} \text{dm}^3 \text{s}^{-1}$ .
<b>2</b>	The overall equation is $2\text{L} + \text{N} \longrightarrow 2\text{P}$ .
<b>3</b>	<b>M</b> is a catalyst and <b>Q</b> is an intermediate.

<p><b>Ans: C (2 and 3 only)</b></p> <p>1 ✗ Rate equation derived from the slow step is <math>\text{rate} = k[L][N]</math>.</p> <p>However, since N is an intermediate, it cannot appear in the rate equation.</p> <p>From step 1,</p> $K_c = \frac{[N]}{[L][M]}$ $[N] = K_c[L][M]$ <p><math>\text{rate} = k' [L]^2 [M]</math>, where <math>k'</math> is <math>kK_c</math></p> <p>Thus, unit for <math>k</math> is <math>\text{mol}^{-2} \text{dm}^6 \text{s}^{-1}</math>.</p> <p>2 ✓ The overall equation can be derived by adding up all the 3 equations and cancelling the species that appears on the left and right side of the equations.</p> <p>3 ✓ M is a catalyst as it is used in first reaction and is regenerated in third reaction. Q is an intermediate as it is produced in second reaction but used up in third reaction.</p>
--

<b>33</b>	Which of the following statements are <b>false</b> ?
1	When an inert gas is added at constant volume to an equilibrium mixture, the equilibrium position of the system will not shift.
2	The magnitude of the equilibrium constant informs us of the relative proportion of products to reactants, providing us information on the reaction rate.
3	When a change in conditions is introduced to an equilibrium system, both the concentration of reactants and products, as well as the equilibrium constant changes.
<p><b>Ans: C (2 and 3 only)</b></p> <p>1 When an inert gas is added at constant volume to an equilibrium mixture, the equilibrium position of the system will not shift. This is because the inert gas added increases the total pressure of the system, but does not change the partial pressures of the reacting gases.</p> <p>2 The magnitude of the equilibrium constant informs us of the relative proportion of products to reactants, providing us information on the <u>extent of reaction</u>.</p> <p>3 When a change in conditions is introduced to an equilibrium system, <u>only</u> the concentration of reactants and products changes.</p>	

<b>34</b>	Equal amounts of two organic compounds, <b>R</b> and <b>S</b> , were added to water and the pH values of both solutions were determined. It was found that the pH of the aqueous solution of <b>R</b> is higher.  Which pairs of compounds could be <b>R</b> and <b>S</b> ?		
		<b>R</b>	<b>S</b>
	<b>1</b>	CH <sub>3</sub> CH <sub>2</sub> OH	CH <sub>3</sub> CO <sub>2</sub> H
	<b>2</b>	CH <sub>3</sub> CH <sub>2</sub> NH <sub>2</sub>	C <sub>6</sub> H <sub>5</sub> NH <sub>2</sub>
	<b>3</b>	C <sub>6</sub> H <sub>5</sub> O <sup>-</sup> Na <sup>+</sup>	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup> Na <sup>+</sup>

**Ans: A (1, 2 and 3)**

**1** R is an alcohol, S is a carboxylic acid. S is more acidic so it has a lower pH than R.

**2** R is an amine, S is a phenylamine. S is less basic than R because the lone pair of electrons from N in C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> is delocalised into the benzene ring. So R has a higher pH.

**3** R is a phenoxide, S is a carboxylate. R is a stronger conjugate base than S because R is from a weaker acid. So R has a higher pH.

<b>35</b>	Iron (III) oxide can be reduced by hydrogen gas to form iron and water.  $\text{Fe}_2\text{O}_3(\text{s}) + 3\text{H}_2(\text{g}) \rightarrow 2\text{Fe}(\text{s}) + 3\text{H}_2\text{O}(\text{g}) \quad \Delta H^\ominus = +96 \text{ kJ mol}^{-1}$ <p>The table below shows the <math>\Delta S^\ominus</math> of the reactants and the products of the reaction.</p> <table border="1"> <thead> <tr> <th></th><th><b>Fe<sub>2</sub>O<sub>3</sub></b></th><th><b>H<sub>2</sub></b></th><th><b>Fe</b></th><th><b>H<sub>2</sub>O</b></th></tr> </thead> <tbody> <tr> <td><math>\Delta S^\ominus</math> /kJ mol<sup>-1</sup> K<sup>-1</sup></td><td>0.090</td><td>0.131</td><td>0.027</td><td>0.189</td></tr> </tbody> </table> <p>Which of the following conclusions can be made?</p>					<b>Fe<sub>2</sub>O<sub>3</sub></b>	<b>H<sub>2</sub></b>	<b>Fe</b>	<b>H<sub>2</sub>O</b>	$\Delta S^\ominus$ /kJ mol <sup>-1</sup> K <sup>-1</sup>	0.090	0.131	0.027	0.189
	<b>Fe<sub>2</sub>O<sub>3</sub></b>	<b>H<sub>2</sub></b>	<b>Fe</b>	<b>H<sub>2</sub>O</b>										
$\Delta S^\ominus$ /kJ mol <sup>-1</sup> K <sup>-1</sup>	0.090	0.131	0.027	0.189										
<b>1</b>	The rate of reaction can only be increased by increasing the temperature of the system.													
<b>2</b>	The $\Delta S^\ominus$ is +0.138 kJ mol <sup>-1</sup> K <sup>-1</sup> .													
<b>3</b>	The reaction is not spontaneous.													

**Ans: C**

**1** The rate of reaction can also be increased by increasing the surface area of iron (III) oxide.

**2**  $\Delta S = 2(0.027) + 3(0.189) - 0.090 - 3(0.131) = +0.138 \text{ kJ mol}^{-1} \text{ K}^{-1}$

**3**  $\Delta G = +96 - (273+50)(0.138) = +51.4 \text{ kJ mol}^{-1}$  (reaction is not spontaneous)

<b>36</b>	<p>During electrolysis of an aqueous solution of rhodium sulfate, 1.00 mol of rhodium ions was discharged at the cathode. This required <math>2.90 \times 10^5</math> C of electricity.</p> <p>Which of the following conclusions can be drawn from the information above?</p>
<b>1</b>	Effervescence will be observed at the anode.
<b>2</b>	The magnitude of the charge on the rhodium ions is three times the charge of an electron.
<b>3</b>	Rhodium is a transition element.
<p><b>Ans: B (1 and 2 only)</b></p> <p><b>1</b> <math>\text{SO}_4^{2-}</math> and <math>\text{H}_2\text{O}</math> will be present around the anode. As <math>\text{H}_2\text{O}</math> is preferentially discharged, oxygen gas is formed, resulting in effervescence.</p> <p><b>2</b> <math>Q = nF</math>  <math>2.90 \times 10^5 = n(96500)</math>  <math>n = 3.01</math> (2 is true)</p> <p><b>3</b> is true with reference to the Periodic Table, but it is not a conclusion from the observations.</p>	

<b>37</b>	<p>The hexa-aquairon (III) ion hydrolyses as shown.</p> $[\text{Fe}(\text{H}_2\text{O})_6]^{3+} (\text{aq}) + \text{H}_2\text{O} (\text{l}) \rightleftharpoons [\text{Fe}(\text{H}_2\text{O})_5\text{OH}]^{2+} (\text{aq}) + \text{H}_3\text{O}^+ (\text{aq})$ <p>Which statements are correct?</p>
<b>1</b>	The corresponding iron (II) ion, $[\text{Fe}(\text{H}_2\text{O})_6]^{2+}$ is less likely to undergo hydrolysis.
<b>2</b>	The iron undergoes a change in oxidation state.
<b>3</b>	This hydrolysis is favoured by low pH values.
<p><b>Ans: D (1 only)</b></p> <p><b>1</b> is correct. <math>[\text{Fe}(\text{H}_2\text{O})_6]^{2+}</math> is less polarising than <math>[\text{Fe}(\text{H}_2\text{O})_6]^{3+}</math> due to its lower charge density. Hence it is less likely to undergo hydrolysis.</p> <p><b>2</b> is not correct. Oxidation state in <math>[\text{Fe}(\text{H}_2\text{O})_5\text{OH}]^{2+}</math> is also +3.</p> <p><b>3</b> is not correct. At low pH, concentration of <math>[\text{H}_3\text{O}^+]</math> is high. By LCP, equilibrium position will shift to the <b>left</b> to reduce <math>[\text{H}_3\text{O}^+]</math> which does not favour hydrolysis.</p>	

<b>38</b>	Halogen-containing organic compounds can be hydrolysed under suitable
-----------	---

conditions to produce the corresponding halide ions,  $X^-$ .

A student investigated the amount of  $Cl^-$  produced by hydrolysing  $CH_3CH_2Cl$  and another halogen-containing compound, **W**. In a given time the amount of  $X^-$  formed was greater with **W** than with  $CH_3CH_2Cl$ .

Which compound could be **W**?

**1**  $CH_3CHCl/CH=CHCl$

**2**  $CH_3CH_2COCl$

**3**  $Cl/CH_2CH_2Cl$

**Ans: C (2 and 3 only)**

With reference to the diagram, the amount of  $X^-$  formed from **W** was at any point in time greater than  $CH_3CH_2Cl$ .

- W** must be able to undergo hydrolysis more rapidly than  $CH_3CH_2Cl$ .
- Option 1:**

Nucleophilic substitution cannot take place as the p-orbital of the chlorine atom overlaps with the  $\pi$  electrons of the  $C=C$  double bond in  $CH_3CHCl/CH=CHCl$ . This strengthens the  $C-Cl$  bond in  $CH_3CHCl/CH=CHCl$ , hence making the chlorine atom unreactive.

Hence, this compound undergoes hydrolysis at about the same speed as  $CH_3CH_2Cl$  because of the other chlorine atom on carbon-3.

- Option 2:**

**Acyl chloride** undergoes nucleophilic substitution more readily than alkyl chlorides due to the relatively larger  $\delta^+$  charge developed in the carbonyl C atom as a result of electronegative O and Cl atoms. Hence, rate of forming  $X^-$  is higher.

- Option 3:**

Each mole of  $Cl/CH_2CH_2Cl$  contains **2 moles of  $Cl$** . Hence, this compound undergoes hydrolysis at about twice the speed as  $CH_3CH_2Cl$ .

- 39** Pethidine is a narcotic analgesic drug, used as a substitute for morphine in the treatment of acute severe pain.

**Pethidine**

Which pairs of compounds would produce pethidine when reacted together?

**1**

**2**

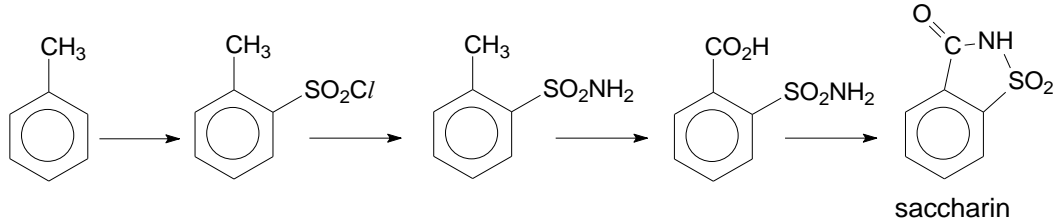

**3**

**Ans: D (1 only)**

Option	Product formed
<b>1</b>	<p><b>pethidine</b></p>
<b>2</b>	

		A different ester is produced.
	3	No product. Acyl chloride do not react with carboxylic acid to form ester

40	<p>Saccharin is an artificial sweetening agent. It can be synthesised from methylbenzene through a series of reactions as shown.</p>  <p>What types of reactions are involved in the series of reactions?</p>	
	1	Condensation
	2	Electrophilic substitution
	3	Nucleophilic substitution
<p>Answer: A</p> <p>Step 1: electrophilic substitution  Step 2: nucleophilic substitution  Step 3: oxidation  Step 4: condensation</p>
