	$\frac{dx}{dt} = 4t^3 - \frac{4}{t}, \frac{dy}{dt} = 8t$ $\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 = \left(4t^3 - \frac{4}{t}\right)^2 + (8t)^2$ $= 16t^6 - 32t^2 + \frac{16}{t^2} + 64t^2$ $= 16t^6 + 32t^2 + \frac{16}{t^2}$ $= 16\left(t^6 + 2t^2 + \frac{1}{t^2}\right)$ $= 16\left(t^3 + \frac{1}{t}\right)^2$ $= \frac{16(t^4 + 1)^2}{t^2}$ Surface area $= \int_1^k 2\pi(4t^2) \frac{4(t^4 + 1)}{t} dt$ $= 32\pi \int_1^k t^5 + t dt$ $= 32\pi \left[\frac{1}{6}t^6 + \frac{1}{2}t^2 \right]_1^k$ $= 32\pi \left(\frac{1}{6}k^6 + \frac{1}{2}k^2 - \frac{2}{3} \right)$ $= \frac{16}{3}\pi(k^6 + 3k^2 - 4)$ Solving $\frac{16}{3}\pi(k^6 + 3k^2 - 4) = 384\pi$, (or $k^6 + 3k^2 - 76 = 0$) we get $k = \pm 2$. Since $k > 1$, $k = 2$.

Q2	Solution
	Multiply throughout by n^{n-1} $n^n x_n = 4(n-1)^{n-1} x_{n-1} + 2$ Let $n^n x_n = y_n$, $y_n = 4y_{n-1} + 2 \text{ where } y_1 = 1$ $4y_{n-1} + 2$ $= 4^2 y_{n-2} + 4 \times 2 + 2$ $= 4^3 y_{n-3} + 4^2 \times 2 + 4 \times 2 + 2$ $= \dots$ $= 4^{n-1} y_1 + 4^{n-2} \times 2 + 4^{n-3} \times 2 + \dots + 4 \times 2 + 2$

Q2	Solution
	$= 4^{n-1} + \frac{2(1-4^{n-1})}{1-4}$ $= 4^{n-1} - \frac{2}{3}(1-4^{n-1})$ $= \frac{-2+5 \cdot 4^{n-1}}{3}$ Hence $x_n = \frac{-2+5 \cdot 4^{n-1}}{3n^n}$.
	Alternative 1 $y_n = 4y_{n-1} + 2 \text{ where } y_1 = 1$ The general solution is of the form $y_n = A \cdot 4^n + B$. $y_1 = 1 \Rightarrow 4A + B = 1$ $y_2 = 6 \Rightarrow 16A + B = 6$ Using GC, $A = \frac{5}{12}, B = -\frac{2}{3}$ Hence $y_n = \frac{5}{12} \cdot 4^n - \frac{2}{3}$.
	Alternative 2 $y_n = 4y_{n-1} + 2 \text{ where } y_1 = 1$ $y_n + \frac{2}{3} = 4\left(y_{n-1} + \frac{2}{3}\right)$ $y_n + \frac{2}{3} = 4^{n-1}\left(y_1 + \frac{2}{3}\right)$ $y_n = \frac{5}{3} \cdot 4^{n-1} - \frac{2}{3}$

Q3	Solution
	$\Rightarrow u \equiv A(u+1)^2 + B(u+1)(u-1) + C(u-1)$ Let $u = 1$: $1 = 4A \Rightarrow A = \frac{1}{4}$ Let $u = -1$: $-1 = -2C \Rightarrow C = \frac{1}{2}$ Let $u = 0$: $0 = \frac{1}{4} - B - \frac{1}{2} \Rightarrow B = -\frac{1}{4}$ $\Rightarrow \int \frac{1}{4(u-1)} - \frac{1}{4(u+1)} + \frac{1}{2(u+1)^2} du = -\ln x + c$ $\Rightarrow \frac{1}{4} \ln u-1 - \frac{1}{4} \ln u+1 - \frac{1}{2(u+1)} = -\ln x + c$ $\Rightarrow \frac{1}{4} \ln \left \frac{u-1}{u+1} \right + \ln x = \frac{1}{2(u+1)} + c$ $\Rightarrow \frac{1}{4} \ln \left \frac{x^4(u-1)}{u+1} \right = \frac{1}{2(u+1)} + c$ $\Rightarrow \ln \left \frac{x^4(u-1)}{u+1} \right = \frac{2}{u+1} + c' \text{ (where } c' = 4c \text{)}$ Sub. $u = \frac{y}{x}$: $\ln \left \frac{x^4 \left(\frac{y}{x} - 1 \right)}{\frac{y}{x} + 1} \right = \frac{2}{\frac{y}{x} + 1} + c'$ $\Rightarrow \ln \left \frac{x^4(y-x)}{y+x} \right = \frac{2x}{y+x} + c$ Since $x > y$, $y-x < 0$, so the general solution is $\ln \frac{x^4(x-y)}{y+x} = \frac{2x}{y+x} + c$
(b)	$\frac{dy}{dx} = \frac{x^3 + x^2y - y^3}{x^2y}$ Let $f(x, y) = \frac{x^3 + x^2y - y^3}{x^2y} = \frac{x}{y} + 1 - \frac{y^2}{x^2}$, $x_0 = 2$, $y_0 = 1$. Using Euler method with step size 0.5, $y_1 = y_0 + 0.5f(x_0, y_0)$ $= 1 + 0.5 \left(\frac{2}{1} + 1 - \frac{1^2}{2^2} \right)$ $= \underline{2.375}$

(i)	$4\lambda^2 - 2\lambda + 1 = 0$ $\lambda = \frac{2 \pm \sqrt{-12}}{8} = \frac{1}{4}(1 \pm \sqrt{3}i)$ $u_r = \left(\frac{1}{2} \right)^r \left(A \sin \frac{r\pi}{3} + B \cos \frac{r\pi}{3} \right)$

Q9	Solution
(a) (ii)	$u_{k+3} = \left(\frac{1}{2}\right)^{k+3} \left(A \sin \frac{(k+3)\pi}{3} + B \cos \frac{(k+3)\pi}{3} \right)$ $= \left(\frac{1}{2}\right)^{k+3} \left(-A \sin \frac{k\pi}{3} - B \cos \frac{k\pi}{3} \right)$ $= -\frac{1}{8} \left(\frac{1}{2}\right)^k \left(A \sin \frac{k\pi}{3} + B \cos \frac{k\pi}{3} \right)$ $= -\frac{1}{8} u_k$ $\therefore \alpha = -\frac{1}{8}$ $\sum_{r=1}^{\infty} u_{3r-2}$ $= \frac{u_1}{1 - \left(-\frac{1}{8}\right)}$ $= \frac{8}{9} u_1$
(b) (i)	Case 1: First signal requires 1 microsecond There are 2 different signals that require 1 microsecond and for the remaining $n-1$ microseconds, a_{n-1} messages can be transmitted, so total number of messages is $2a_{n-1}$ Case 2: First signal requires 2 microseconds There are 3 different signals that require 2 microsecond and for the remaining $n-2$ microseconds, a_{n-2} messages can be transmitted, so total number of messages is $3a_{n-2}$ Combining the two cases above, the recurrence relation is $a_n = 2a_{n-1} + 3a_{n-2}$
(ii)	$\lambda^2 - 2\lambda - 3 = 0$ $\lambda = -1 \text{ or } \lambda = 3$ Hence $a_n = A(-1)^n + B(3)^n$ Note that $a_1 = 2$ and $a_2 = 7$ $-A + 3B = 2$ $A + 9B = 7$ $A = \frac{1}{4}, B = \frac{3}{4}$ $\therefore a_n = \frac{1}{4}(-1)^n + \frac{3}{4}(3)^n$

Q10	Solution
(i)	When $\theta = 0, r = \frac{a}{1+e}$. When $\theta = \pi, r = \frac{a}{1-e}$. $\frac{a}{1+e} + \frac{a}{1-e} = \frac{2a}{1-e^2} = 5.9$ $\frac{\frac{a}{1-e}}{\frac{a}{1+e}} = 2.15 \Rightarrow \frac{1+e}{1-e} = 2.15$ $\Rightarrow e = 0.3650793 \approx 0.365$ $\frac{2a}{1-e^2} = 5.9 \Rightarrow \frac{2a}{1-0.3650793^2} = 5.9$ $\Rightarrow a = 2.55682 \approx 2.56$
(ii)	Required time orbital period $= \frac{\text{Area from } \theta = \frac{\pi}{2} \text{ to } \theta = 3}{2(\text{Area from } \theta = 0 \text{ to } \theta = \pi)}$ $\frac{\text{Required time}}{130} = \frac{0.5 \int_{\frac{\pi}{2}}^3 \left(\frac{a}{1+e \cos \theta} \right)^2 d\theta}{2 \left(0.5 \int_0^\pi \left(\frac{a}{1+e \cos \theta} \right)^2 d\theta \right)}$ Required time $= \frac{8.11021694}{25.45271596} \times 130 = 41.423 \approx 41.4$ days
(iii)	Additional time required orbital period $= \frac{\text{Area from } \theta = 3 \text{ to } \theta = \pi}{2(\text{Area from } \theta = 0 \text{ to } \theta = \pi)}$ $\frac{\text{Additional time required}}{130} = \frac{0.5 \int_3^\pi \left(\frac{a}{1+e \cos \theta} \right)^2 d\theta}{2 \left(0.5 \int_0^\pi \left(\frac{a}{1+e \cos \theta} \right)^2 d\theta \right)}$ Additional time required $= \frac{1.143695252}{25.45271596} \times 130 = 5.8414$ ≈ 5.84 days
	$25x^2 + 4y^2 - 50x_0x - 8y_0y + 25x_0^2 + 4y_0^2 - 100 = 0$ $25(x^2 - 2x_0x + x_0^2) + 4(y^2 - 2y_0y + y_0^2) = 100$ $25(x - x_0)^2 + 4(y - y_0)^2 = 100$ $\frac{(x - x_0)^2}{2^2} + \frac{(y - y_0)^2}{5^2} = 1$ Thus, length of semi-major axis of Q is 5.

Q10	Solution
	$\frac{(\text{Period of } Q)^2}{(\text{Period of } P)^2} = \frac{5^3}{(5.9/2)^3}$ $\text{Period of } Q = \sqrt{\frac{5^3}{(5.9/2)^3}} \times 130^2 = 286.8569 \approx 287 \text{ days}$
